

To the VIPs of the Token Redemption Carnival, the steadfast subscribers of AIG:

Fridays always carry a particular weight. For many Americans, Friday night means barbecues, beer, and friends. But for Wall Street, Friday has a different timbre—it's the moment when the books close, when capital makes its final sprint in the last trading hours, or quietly pivots to a new position.

And on days like today, the market's pulse is set precisely to the rhythm of Jackson Hole's decisive hour.

You know, this gathering began back in 1978 as a modest monetary

forum, barely noticed outside academic circles. Its significance changed forever in 1982, when Paul Volcker himself appeared, securing its place in financial history. From then on, each Jackson Hole meeting has rung like a market bell—sometimes waking investors from complacency, sometimes forcing the largest pools of capital to redraw their lines of engagement.

Once the U.S. markets open, nearly every eye will turn to this meeting.

It is more than an academic exchange; it functions as a signal tower. Much like sailors at sea who spot a distant lighthouse, investors can decide whether to press forward with speed or turn back to avoid the storm.

At the same time, we cannot overlook another battleground: the subscription progress of the new AIG token. These are not just sterile figures on a chart; they represent sentiment and confidence distilled into numbers.

Some say digital assets echo the gold rush of the 19th century—

when men and women, driven by dreams, carried shovels and pans westward, hoping to strike gold. Today, the tools have changed to wallet addresses and transaction keys, yet the look in the eyes of those chasing opportunity remains exactly the same.

Every shift in subscription numbers is, in truth, a heartbeat of market conviction.

During World War II, there was a squadron of pilots constantly worried their planes might be shot down. They asked a mathematician to advise on how to reinforce the aircraft.

Most believed the solution was obvious: add armor where the bullet holes were most concentrated, since those were the “most damaged” areas. But mathematician Abraham Wald reminded them of a crucial truth—the planes that returned with holes were the survivors. The real vulnerabilities, he explained, were in the places where no bullet holes were found at all.

The lesson is clear: true risk often hides in the corners we cannot

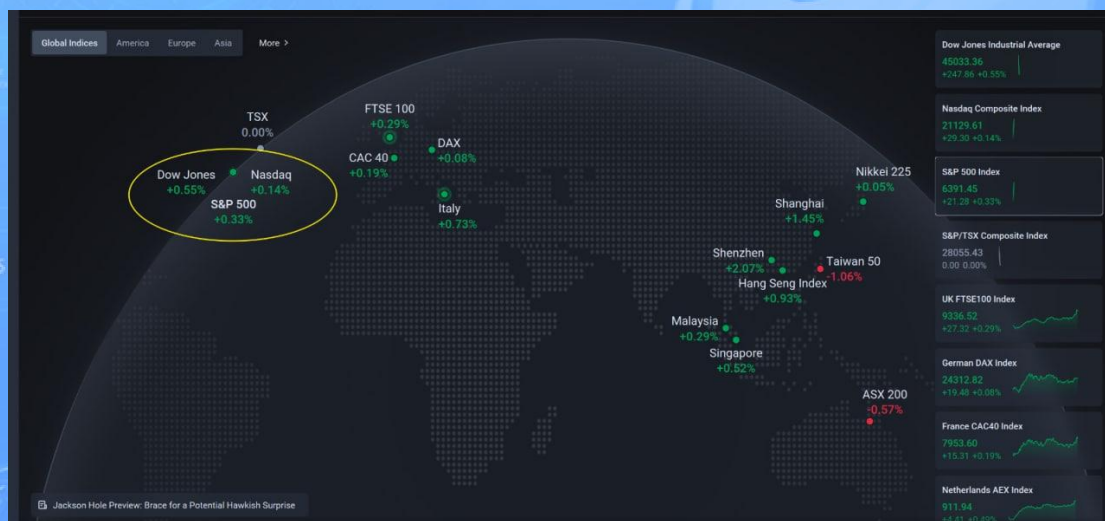

easily see.

The same holds in today's markets. The noise may feel overwhelming, but investors must look past the surface chatter and focus on the deeper trends and underlying logic.

At this very moment, we stand at a pivotal juncture—the bell of Jackson Hole tolls in the distance, while the subscription numbers for the new AIG token quietly move upward. This is not merely the closing of a chapter, but the opening of a new journey.

And remember: the market never rewards fear. Wealth, in the end, favors those willing to act.

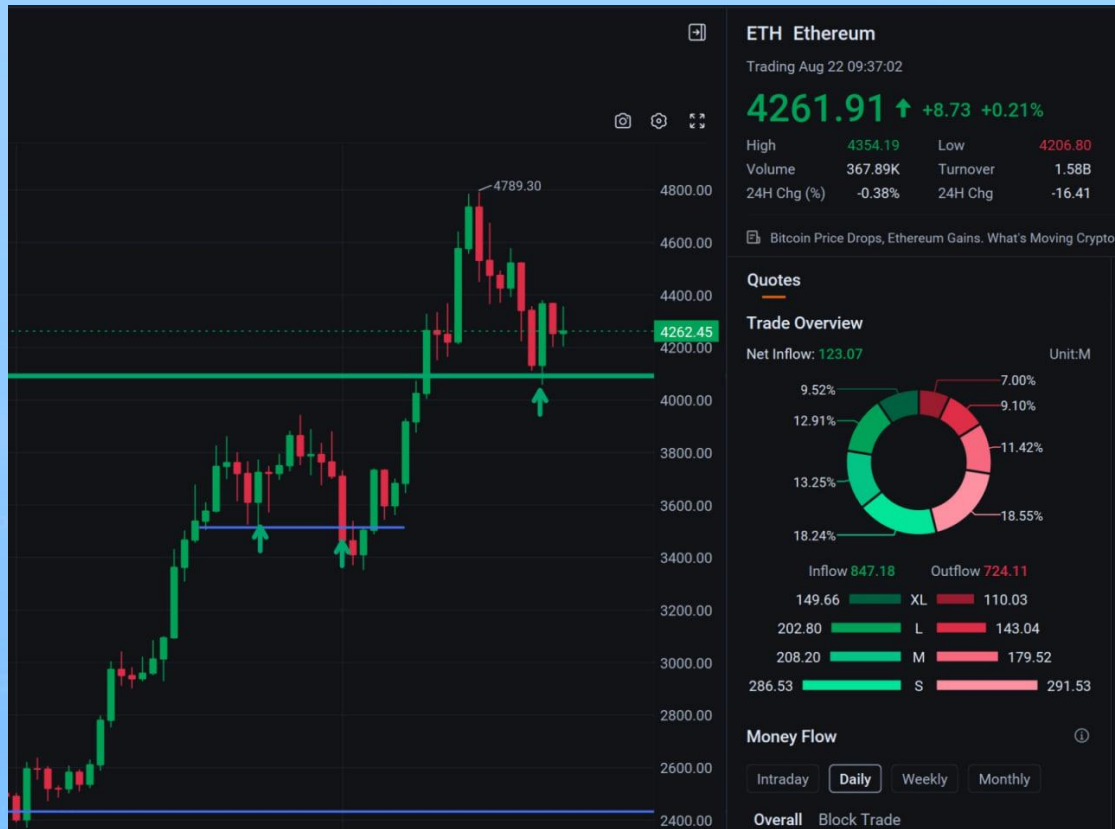

Looking at the pre-market futures, one can already sense the contours of today's trading session. Take the S&P (.SPX) as an example: the modest rebound before the open suggests that some of the market's tension has eased. Still, a word of caution is warranted. Before Liberation Day, sentiment was equally buoyant—only in hindsight did it become clear that such optimism may have been little more than a lure.

Now, valuations are higher, and many equities are trading at even loftier multiples.

The U.S. economy continues to move forward in a state that is neither weak nor strong. A cooling labor market coexists with ongoing expansion. Historical comparisons indicate that layoffs remain at relatively low levels, not yet signaling a pronounced downturn. Within the Fed, divisions have deepened, and that very divergence has made it harder for markets to wager on the path of policy. All eyes now wait for Powell's decisive word.

In such a climate, the most prudent course is to remain watchful—neither rushing to build positions nor hurrying to participate.

When it comes to crypto, this is one of those rare moments that feels like a comfortable entry point.

Why?

Because ETH has been oscillating between 4,200 and 4,300 amid declining volatility. Should fear drive it briefly below 4,100, that would mark a classic buy-the-dip opportunity—an opening that doesn't present itself often in the course of trading.

Right now, the setup is favorable.

Moreover, the Fed is almost certain to cut rates in September. The trajectory mirrors last year's, and the market behavior suggests ETH is entering a phase of steady institutional accumulation—strikingly similar to the pattern we witnessed when institutions were steadily buying Bitcoin.

This rate cut is no ordinary move. We must understand it against the backdrop of a new round of monetary easing, shaped in part by the political pressure of the Trump administration.

Very soon, we may be standing at the threshold of an era where rates fall below 4%.

Are you ready for that?

Of course, we will not allow short-term turbulence or market uncertainty to cause us to miss out on truly compelling opportunities.

Consider the past month: we have navigated the AI Action Day initiative, the Cryptocurrency Week, and the moments of new token

subscriptions. At each pivotal cycle, we have managed to find favorable positioning and to safeguard the outcomes of our investments.

Today will be no exception. The subscription for the new AIG token is already in high demand.

A clear reflection of the future promise of AI combined with genomic medicine, a revolution aimed not at speculation but at tangible advances in human health. It is precisely this kind of project that gains recognition in capital markets, because every single USDC committed is, in effect, a vote of confidence in its potential.

Don't be distracted by what people say. Watch carefully what they choose to do.

Generates something

As we look back on the weeklong celebration of the Token Redemption Carnival, we recognize something fundamental: this was never just another trading event. It carried the cadence of a national festival—an occasion that quickened the pulse and drew people together.

In moments like these, we often borrow from the language of American sports and call it a “Super Bowl moment”—a time when anticipation builds, attention converges, and the crowd shares in a collective climax. For the world of crypto, this Carnival was precisely that.

The charts tell the story: within days, the price of Token NQT leapt forward again and again. It not only ignited market enthusiasm but also confirmed the sheer force of this movement.

Back in the 1980s, Wall Street had its first taste of the tech-stock surge on Nasdaq. Many at the time could not understand why “virtual” technology firms might underpin real wealth. Yet a decade later, those once-doubted names had grown into the global giants that now shape our daily lives.

By the same logic, as we stand here reflecting on the Carnival, it feels very much like standing at the threshold of the future—watching history, in its own way, begin to repeat itself.

So, as we stand on this stage today and reflect on the journey, what we feel is not only excitement but also conviction—conviction drawn from the echoes of history, reinforced by data, and, most importantly, inspired by the miracles created together with friends from the U.S. and around the world.

This was never just an event; it was a declaration: the future of wealth is no longer a private game for the few, but a celebration shared by all.

The rise in the price of Token NQT speaks directly to you. As the market value of your holdings climbs, you are already benefiting from a gradual process of ownership through investment. The only distinction is that your share may be somewhat smaller.

But remember, what you hold is a gift from my Quantitative Think Tank Center—a recognition of your growth alongside us, and a medal for witnessing Acumeta's steady optimization. Looking ahead, with the prospect of rate cuts, we can expect even greater token rewards.

The question is: will you choose to hold them for the long run?

The AIG token stands as a reflection of humanity's enduring need for medical and cultural advancement. It is more than a digital asset—it is a mission. Our commitment lies in supporting and driving forward an emerging revolution in healthcare. From the perspective of purpose and value, I must say: we need to subscribe to it.

The AIG token represents the pulse of the entire crypto community.

We are living through a new era, one where the pursuit is not for noise or speculation, but for projects that hold genuine value, meaning, and potential. From the standpoint of market-driven choice, I must say: we need to subscribe to it.

The AIG token embodies the standard of excellence that you and I have come to expect from INDEXBIT Exchange. It reflects trust—trust in the platform, trust in the process, and trust in the decisions we make together. From a standpoint of verification and credibility, I must say: we need to subscribe to it.

What we pursue is not merely wealth. What drives us is the sense of accomplishment and purpose we discover along the journey itself.

So, when people speak of the AIG token, remember this: it is not just another coin. It is a continuation of human culture, a natural outcome of market evolution, and a tool for investors to reconcile value with trust. Just as the old spirit of the American cowboy reminds us: saddle up on your own brand. When you subscribe to the AIG token, you're leaving a mark that belongs uniquely to your

own future.

To ensure that the AIG token subscription is more than just an empty thrill, it is clear that the courage and decisiveness we demonstrate while validating one promising project after another will yield substantial rewards.

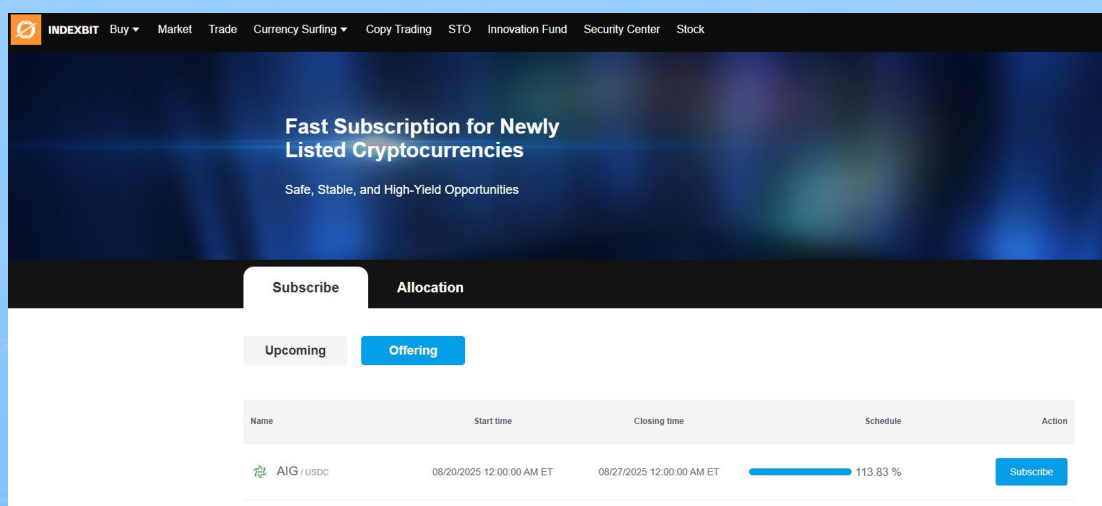

But have you completed your subscription today?

If not, now is the time to engage. Use the NQT token in your account on INDEXBIT Exchange and reach out to the official support manager. Let her know you wish to stake these tokens to access a short-term financing amount—800 USDC, as outlined in the official program.

Then, apply this capital to subscribe to the new AIG token.

Yes, we have never been fond of standing on the sidelines applauding. In the arena of life, it is up to us to make that damn ball drop through the hoop.

Trust your own hot hand—you deserve a moment of brilliance.

Some first-time subscribers to the AIG token may begin to worry:

Will I lose my subscription?

Will the AIG token achieve a successful listing and deliver the anticipated returns?

First, focus on whether the AIG token secures the qualifications for a successful launch. This is not a game of blind luck—it is determined by the market itself.

As the chart shows, according to the subscription progress data for

the AIG token, it has astonishingly surpassed 100%—a truly exciting milestone, achieved in just two days!

Indeed, the market's momentum is extraordinary. More than \$120 million has already been entered to subscribe to the AIG token. Yes, that's right—even if your participation amounts to only 800 USDC, in today's globalized blockchain market, anyone with a INDEXBIT Exchange account and USDC can join.

Of course, holding BTC/ETH also qualifies you to participate.

Therefore, I announce—based on the official interpretation of the rules for the new token STO subscription—that once the AIG token subscription progress surpasses 100%, this token is guaranteed to be listed!

This is a thrilling moment!

A milestone worthy of note in the blockchain world!

Folks, did you catch that?

Now, let's consider what it means once the AIG subscription progress exceeds 100%. Do you recall yesterday's program insights?

It means that in the upcoming allocation mechanism, as soon as you secure a share, the listing price of each AIG token will exceed 0.5 USDC.

This is your moment to generate profit, and it is also your focal point for witnessing the impact of this high-quality project.

Reviewing yesterday's insights, it is clear that once the AIG token subscription progress surpasses 100%: It is confirmed—the token has secured its listing qualification.

It is also confirmed that, as long as you eventually secure an allocated share, the price of each AIG token will exceed 0.5 USDC.

This is precisely why you will want to continue monitoring it in the **Generates something days ahead.**

Because you need to know: how far could its profit growth go?

1 USDC? 2 USDC? I can't say for certain.

Yet, based on the valuation projections from two days ago, the AIG token is expected to grow by 300 – 500%. In other words, it could reach somewhere between 1.5 and 2 USDC.

Ultimately, however, we rely on the market to decide.

We are not idealists—we respect objective reality.

Will you join us to witness it?

Certainty is the donut the market craves—and it's also my favorite hot latte.

Yes, there's a comforting warmth in that feeling. Just like Powell's remarks today: he didn't explicitly announce a rate cut, yet his words carried a dovish undertone, instilling confidence in the market.

In other words, my call for a September rate cut has been fully vindicated—no surprises here.

From this morning's speech, I captured three key highlights:

1. Recognition of a shift in risk balance, signaling the need for policy adjustment;
2. Abandoning the flexible average inflation framework of 2020, meaning rate cuts need not wait until inflation drops below 2%;
3. Acknowledgment of downside risks in employment, clearly a dovish signal.

These three points from Powell effectively open the door for a September rate cut.

So, guys, are you ready to embrace the wealth growth and compounding gains that a certain rate-cut cycle promises? Do you know how to make it happen?

Of course, all of this stems from the forward-looking judgments and

forecasts I began making last month—and from diligently applying my reasoning to optimize my investment portfolio.

Half the credit, I must admit, goes to the support of Acumeta's big data reasoning engine.

Naturally, today does not determine the entirety of future wealth—but today's actions will shape tomorrow's profits.

I have already mapped out my investment strategy for the coming month, three months, even half a year—and I am executing it step by step, letting it grow into tangible wealth, into the moment when my Quantitative Think Tank Center's valuations take flight. And my fellow quantitative strategy members—will you choose to follow in my footsteps?

Use your own experience to tell me: let the joy of profit from your ETH purchased at \$4,200 be your guide—will you follow  
Generates something steadfastly?

The right path over the past month or two has positioned us exactly where we need to be today.

We are on the cusp of realizing more on-chain wealth—and of course, the very first step you need to take today is to subscribe to the new AIG token. Even if it's just 800 USDC, consider it the spark you've been hoping for, illuminating a critical waypoint on your crypto journey.

As for where the AIG token's initial listing price might land, this afternoon I will provide an in-depth analysis and a review of the subscription progress data, giving you clarity and a definitive answer to the question.

The Fed has decided to unleash a ‘monetary flood,’ and so we must position ourselves aboard the crypto ‘Noah’ s Ark.’ As the tide rises, we will let profit and tangible results demonstrate the dawn of a groundbreaking Acumeta quantitative system—and we eagerly await that moment.

Folks, let’ s raise a cup of sweet coffee, sending a little extra joy into your afternoon. Until this afternoon!

Ladies and Gentlemen,

Welcome back to our special opening today.

This Friday in Jackson Hole, the world's investors had their eyes fixed on one speech. Chair Powell of the Fed finally opened the door to a September rate cut.

You might ask: is this the result of political compromise, or a genuine economic calculation?

To be candid, my concern lies less in the why and more in the what next.

There's an old American saying that puts it well: don't just count how many storms come your way—learn to dance in the rain.

For me, a rate-cut cycle is nothing less than rain granted by providence. Our task is to channel that rain into streams that nourish lasting wealth.

Now, let's turn to this week's Token Redemption Carnival.

If Wall Street's rate cut is the steady drumbeat of macroeconomics, then the crypto market's carnival is the rock rhythm of a younger generation—fierce, unrestrained, brimming with imagination.

From across the nation and around the globe, crypto enthusiasts gather as though it were a summer beach party in California—vibrant, exuberant, alive with possibility.

The price of token NQT keeps surging, lighting up the night sky like fireworks.

This month, this week, and today—ETH’s trajectory lit what many call the “God candle,” setting a new all-time high.

Generates something

In the world of investing, most people prefer to measure success and failure with cold numbers. I tend to see it more as a parable.

Remember the biblical story of sowing and reaping?

A farmer never sees fruit overnight, but with patience and steady care, the harvest always arrives in time.

ETH' s candle serves as that reminder: today' s persistence is never wasted; the efforts of the past return in a different form.

Historically, rate cuts have often led to a repricing of assets.

After the 2008 financial crisis, the Fed pushed interest rates to zero.

Many panicked, locking their cash away.

But some chose to place their capital in technology stocks and emerging assets—and they became the winners of the following decade.

It is not unlike a classic moment in a Western: when bullets are flying, the hero doesn' t waste time complaining about the noise—he looks for the chance to fire back.

Today, we find ourselves in a similar position.

Generates something

My grandfather often told me a story when I was young. During the Great Depression, there was a restaurant owner who, at a time when everyone else was cutting back, decided to give every customer a bowl of soup—free of charge.

At first, people thought he had lost his mind. But before long, his restaurant's reputation spread across the state, and when the economy recovered, he had already become the biggest winner.

The lesson was clear: when others are paralyzed by fear, the courage to take a single step forward often marks the beginning of a turning point.

So when we look back at this past week—whether at the signals from Jackson Hole or the exuberance of the Carnival—the message is essentially the same: don't get trapped in the debate. Learn how

to dance with the wind.

At this moment, ETH is trading near \$4,850.

If you blink, you' ll miss it.

Carry this conviction as you face the future: the rate cut is the wind,  
ETH' s candle is the light, and we are the soul bold enough to dance.

As the chart above shows, on the evening of August 14, the CEO of

Coinbase published a comparison of returns across major asset classes. ETH and BTC surged far ahead—well beyond expectations—outpacing both the S&P 500 and gold.

This is a crossroads of tradition and innovation, of past and future. It is precisely in such moments that one needs a discerning eye to illuminate the wisdom of building wealth on-chain.

I strongly agree with this perspective and find reason for optimism in such forward-looking judgment.

Why is this happening? I don't believe it requires elaborate economic theories to explain. It comes down to fundamentals.

First, the pressure of U.S. debt is undeniable—whether in the Biden era or the Trump era. That much is clear.

But under this administration, that pressure is moving closer to the brink of crisis. It is like a person who has lived on borrowed money for too long and finally reaches the point where the debts can no longer be sustained—bankruptcy becomes inevitable.

Of course, the U.S. government will never allow outright collapse.

Whether it is a campaign team or a Cabinet, there will always be brighter minds at the table.

That is where concepts like a “Crypto Capital” and a strategic reserve in BTC begin to take shape.

When Donald Trump took office, the very first thing he said to the Fed was a request for Chair Powell to cut rates sooner rather than later.

From that moment on, he applied pressure in every forum and through countless remarks, pushing for easier monetary policy. Even today, Trump maintains that Powell opened the door to rate cuts far too late.

This makes one thing clear: an era of government-directed monetary easing was always inevitable. And in such an environment, cryptos will become the natural beneficiaries.

So why are BTC and ETH often regarded as the “chosen ones” ?

Because the blockchain rests on two defining features. First, Btc carries the qualities of a digital gold reserve. Its value tends to rise

more sharply the looser monetary policy becomes—while at the same time being far easier to transact than physical gold.

Second, ETH functions with the attributes of a foundational security.

It embodies both transactional value and a rapid conduit for stablecoin circulation. Taken together, these qualities support America's deeper push toward building a true "Crypto Capital"

What is a stablecoin? Through the three major crypto bills passed in Congress, stablecoins have been granted legal standing, recognized with monetary attributes, and tied to a reserve base—anchored directly to U.S. Treasuries.

In other words, you, I, and every individual across the globe who holds stablecoins, in effect, hold U.S. debt.

This grants U.S. Treasuries a new freedom of circulation. And what is debt's greatest vulnerability? Its inability to move.

Once debt can move, once it can circulate, the burden begins to find its own resolution.

Stablecoins unlock precisely this circulation of U.S. debt. And when is demand for stablecoins at its highest?

It is always in a crypto bull market.

It is always in a BTC bull market.

It is always in an ETH bull market.

And what drives such bull markets? Inevitably, accommodative monetary policy.

A Fed rate cut means lower interest payments on U.S. debt, making new issuance easier and easing the immediate fiscal strain.

This is why today, with the Fed's decisive signal of a September rate cut—and with two cuts expected this year—the trajectory becomes clear.

Now you know where the balance of victory begins to tilt.

Let's set aside, for the moment, the question of how much U.S. equities might rise during a rate-cut cycle—or the possibility that complex factors could dampen economic expectations and trigger a market pullback. The prosperity we see today is not the whole story.

But crypto is different. In every single rate-cut cycle of the Fed, it has never missed a bull market. BTC has proven this. ETH has proven this.

Cryptos provide a release valve for U.S. debt pressures—something equities cannot achieve. That is why, when the Fed opens the door to easing, the brightest stocks in the market are invariably those tied to crypto and blockchain. Their logic of value is anchored, unambiguously, to BTC and ETH.

Well—that is precisely why we take no detours, no winding paths.

We go directly to building reserves in BTC and ETH.

As for myself, I have a particular preference for ETH. I told you to

buy it at 4,000. I told you again at 4,100. When the stock market opened this morning, I still said: buy it, hold it, stay with it.

And the result speaks for itself—you have already witnessed the proof of its remarkable profit.

In November of 2021, ETH set a then-historic record of \$4,795.

But today, with Powell preparing to open the gates of rate cuts—the floodgates of liquidity—ETH has already pressed past that number, reaching \$4,800.

You may ask: is there still higher ground ahead?

The answer is both certain and resolute—yes.

The next stop is \$7,000, before December.

Why such confidence? Because Acumeta has provided me with the objective facts and historical precedent to support this inference.

Consider BTC's trajectory after the Fed's rate cut last September.

On September 18, 2024, when the Fed announced its decision, BTC surged from \$67,000 to \$108,000—an increase of 70%.

Now apply that same 70% measure to ETH. Where does it take us in the wake of this September's rate cut?

Well above \$7,000.

So, do you still believe that now is not the right moment to step in?

An old film, *There Will Be Blood*, tells the story of Daniel Plainview, a solitary silver prospector who, step by step, builds an oil empire of his own making.

In that narrative, “Black Gold” was oil—the single most important source of energy of its era, the force that shaped the course of industrial development. On Ethereum, the equivalent of “Black Gold” is Gas.

Gas is the unit of computation and transaction cost that powers the Ethereum network. Every trade executed, every smart contract deployed, requires Gas. And Gas, in turn, is paid in ETH.

Even the USDC circulating in your account today requires ETH in order to move and function. Without ETH, the entire Ethereum network grinds to a halt. It is the essential driver of the system, its value tied directly to the level of usage and demand across the network.

In the film, the preacher Eli embodies the weight of traditional belief, seeking to bind Daniel through “morality” and “spirit.” In the crypto world, BTC plays a comparable role for many: it represents the conviction in a form of “digital gold,” incorruptible and resistant to censorship—a store of value that is, by design, beyond interference.

ETH, by contrast, is pragmatic. If *There Will Be Blood* captured the rise of capital in the industrial age, ETH might be seen as the modern counterpart—the “Black Gold” saga of the digital era.

And to hold ETH in abundance is, in many ways, to stand as a protagonist in this new golden age of blockchain.

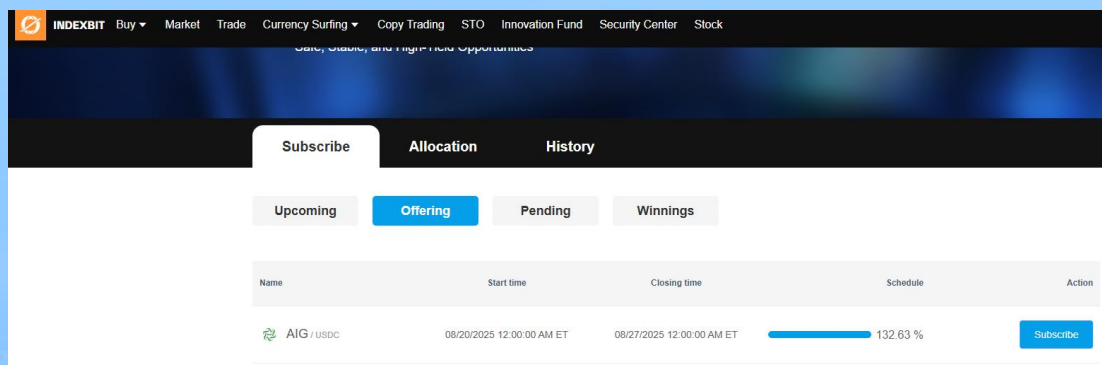

Of course, in this era of the Fed rate cuts, the engine of wealth creation is not limited to ETH alone—it also includes our Quantitative Think Tank Center token, NQT.

Today, as you can see, it continues to move upward alongside the broader market. This reflects that the Redemption Carnival of the past week was positioned with precision and foresight. Such a moment signals not only objective, reliable reasoning, but also the growing maturity of Acumeta. Through the stock compensation – backed validation program you engaged in, the practical experience and progress you gained have yielded meaningful optimization.

Folks, your contribution here has been real. And my way of giving back is through the profits generated in the Win the Race for Reserve Digital Token Challenge and the allocation of token NQT.

With its market value consistently strengthening, I have been able to refine my quantitative strategy portfolio to provide you with a

secure, long-term, and efficient path to wealth growth. Don't you like this?

To engage in an investment experience within the crypto world that aspires to absolute security, we have chosen to leverage staked financing tokens to access short-term, interest-free capital: 800 USDC. This represents a spark of wealth ignited by providence—much like the torch of the Statue of Liberty, illuminating the boundless ideals of freedom, innovation, and an unrestricted financial universe in the hearts of every American.

Participating in the AIG new token subscription is, at once, an expression of commitment to human health and medical advancement, and a celebration of the noble spirit of free finance on the blockchain.

It is precisely this profound love and compassion that allows AIG's

profits to unfold before us.

Why speak of AIG' s profits now?

By opening your INDEXBIT crypto exchange account, you can witness for yourself—as the subscription progress chart shows—astonishing results. My goodness, it exceeds imagination, currently holding steady at more than 130%.

And what does this signify?

AIG New Token Subscription Progress Chart: surpassing 130 percent, indicating that more than \$150 million has already been committed to subscribing.

Indeed, this critical figure demonstrates that, once we secure an allocation, your cost remains at just 0.5 USDC. Yet the market-driven demand for subscriptions has pushed the token' s initial listing price higher. Based on the current progress chart, we can estimate:

$$1.3 \times 0.5 = 0.65 \text{ USDC.}$$

Well—if the token were to list at this very moment, its opening price would be set at 0.65 USDC.

This illustrates the transparency and fairness inherent to blockchain technology. Unlike new equities such as BLSH, where investors can only guess whether the listing price might be \$90 or \$85, the blockchain gives clarity and certainty.

Does this forward-looking progress chart, with its unique guiding value, provide you with an exceptional experience, guys?

Clearly, the AIG new token subscription campaign shows no sign of stopping—not for a moment, at least until the deadline.

It will not pause like the stock market on a Friday, retreating into a weekend recess. In the crypto world, time runs 24/7. Whether we are attending a party tonight or having a quiet family dinner, nothing can halt the engagement of crypto participants from around the globe.

What we need to do is simple: over the course of the weekend, continue monitoring the trajectory of the AIG new token

subscription progress chart. I will not speculate subjectively, but I trust the flawless results driven by market demand.

In any case, we are already in profit today. Every day that follows is an accumulation of gains, a blessing from providence. Guys, will you light a fine cigar, pour yourself a glass of whiskey, and toast your own decision? Go ahead—do exactly that.

Ladies and gentlemen, my fellow winners of the new era of on-chain wealth:

As we approach the close of this weekend, take a moment to look back—doesn't every step radiate the essence of “perfection”?

The Token Redemption Carnival—perfect in every sense—bringing players from around the globe to raise their glasses on the same blockchain stage;

The INDEXBIT crypto exchange service—perfect—where minimal risk meets maximal opportunity, dancing together with a steady, elegant rhythm;

The staking and financing service—perfect—granting us the

confidence to advance while staying grounded;

And the AIG subscription campaign—perfect—striking a match that ignites the future of healthcare and technological revolution.

Meanwhile, Federal Reserve Chair Powell delivered his unmistakably dovish remarks, opening the door to a September rate cut;

And ETH’ s surpassing gains—perfect like fireworks lighting up the weekend night sky.

And we mustn’ t forget one more perfection—the one unfolding here, now: you, taking action, stepping forward with courage.

Regarding the INDEXBIT crypto exchange, I want to once again express my gratitude for the team’ s service and trading experience. Have you felt the same way?

This exchange offers a comprehensive suite of capabilities—ranging from token trading, custody, and currency "surfing," to innovative investment funds, STO subscriptions for new tokens, smart-follow

systems, and P2P merchant networks built on reputational trust.

What I hope is that you, alongside me, will continue to test and affirm the long-term value of these services. From past data, I know that few exchanges deliver at this level of quality. Yet here, with more than \$200 million worth of my own tokens actively operating, I have experienced both security and reliability.

This assurance is further reinforced by the exchange's MSB license, its transparent asset reserves, its participation in the SEC's "super app" initiative, and the anchoring of settlements and transactions to USDC under the Stablecoin Act. Together, these represent a new benchmark of compliance—one that should give you full confidence in your participation.

And should any questions remain, you may always reach out to the exchange's official support manager for direct assistance.

Facing such a perfect weekend, how should we celebrate?

Let love, sincerity, and boundless generosity be first reserved for our families. That is the true hearth of our hearts. Without the support of family, no matter how great your wealth or flawless your investments, they remain nothing more than cold, lifeless numbers.

Wealth is like the crops a farmer sows.

Be it corn or wheat, you must have faith at planting, patience through storms, and gratitude at harvest. The AIG token subscription, ETH' s rally, the Fed' s anticipated rate cuts—all these are seasons of the same field. In spring, we plant hope; in summer, we endure the storms; in September and October, we reap in autumn.

Today we have witnessed many instances of “perfection,” yet remember—they are still on their journey, still requiring our patience and action.

Most importantly, you have already stepped onto this path with courage.

In the future, you will be the emerging victors of on-chain wealth. So—a perfect weekend is not a period, but a new beginning.

Next Monday, I invite you to continue following my session.
