

Good Thursday morning, BOM stacked subscription warriors:

This morning's pre-market ADP data—the “mini non-farm” number—what hidden truth lies behind it? And how might that truth reshape our future, especially for those surfing the waves of crypto?

When the ADP figure came out below market expectations, my first thought was not of macroeconomics, but of an old friend of mine—Jimmy, who runs a small factory in Connecticut. A month ago, he confided to me with a worried face:

“Buddy, I’m offering good wages, but I can’t hire anyone. The young people seem to be all doing online streaming or currency surfing from home, for us in traditional manufacturing, it’s getting really tough.”

Jimmy's story is a mirror of what the ADP data reflects, it is not a cold statistic, but the lived reality of ordinary Americans.

It reminds us that the labor market is not as hot as many imagined, on the contrary, it is entering an unexpected cooling phase.

It is as though we had long assumed a high-speed train had a failing brake system, yet now we discover it is slowing down, and at a pace faster than we expected.

When Fed officials see this data, they must be thinking: “Good, this is the signal we have been waiting for. It is time to begin cutting rates.”

Rate cuts will unleash a flood of liquidity. Imagine the Fed opening a massive faucet, pouring a steady stream of “dollars” into the market. And where will that capital flow?

It will flow into areas that can appreciate and still remain below the level of inflation.

The surge of liquidity is like infusing fertile soil with abundant nutrients, allowing crypto to grow with explosive vitality.

This is not merely about rising prices, it is about the flourishing of the entire crypto ecosystem.

For those watching the BOM new token subscription, this is nothing less than a gift from heaven. In a market flooded with capital, how much attention and demand will a promising new project attract? Its growth will be faster than we can imagine.

It is like a grand banquet, where the BOM subscription is the most exquisite dessert—everyone wants a taste. Subscribing to BOM is not merely an act of participation, it is a signal that you have claimed your place in the great transfer of wealth.

Pals:

This ADP report is not just a number, it is a map, a treasure map pointing to the future. It tells us the wind has shifted, the rules of the game have changed. Those who hesitate and remain on the sidelines will miss the feast.

And those of us who prepare early and understand the trend will

become the greatest winners at the table.

Today's signal could not be clearer: the ADP employment report has come in below expectations, and the Fed's September rate cut is now almost a certainty. In this transfer of wealth amplified by crypto, the question is: will you stand by as a spectator, or step forward as a true participant?

Generates economic growth  
Some may assume that when the Fed announces a rate cut, isn't it just a press conference, just another statement? What's the big deal?

Listen carefully, this is not a simple "announcement." It is a signal

—it is the starting gun.

Let's look back at history. Last year, on September 18, the Fed announced a rate cut. That was no coincidence. That date became like a “birthday” —a birthday for rate cuts.

And this year, market chatter grows ever clearer, on September 17, the very same week, nearly the very same day, just one day apart, the Fed is widely expected to make that decisive move again.

The festivities are about to start!

This is where "smart money" moves first. The channels for “risk-free arbitrage” are shifting.

As Treasury yields decline and bank interest becomes negligible, capital measured in the hundreds of millions, even tens of billions, is already on the move, searching for higher returns.

Promising, high-potential new tokens have become the "hot commodities" in the eyes of billions of dollars seeking [risk-free arbitrage]

It is like playing a game where many paths once led to victory, but now the easiest and safest one has suddenly been closed. And your only choice is to take the similar path that remains, still 0 risk, but offering even greater rewards. And for us, subscribing to the new BOM token is precisely that "shortcut"

Investors accustomed to earning returns through Treasuries and bank interest will increasingly turn to BOM subscriptions as their [0 risk] action of choice. It is a familiar investment method, and the first step in moving their assets onto the chain.

When the Fed begins cutting rates, a low-rate environment drives the "discount rate" lower, meaning that future returns are worth far more in present value.

And what does this imply? That the very same new token project, in a rate-cut environment, will be valued several times higher than in a period of rising rates.

Program knowledge TIPS – extended insight: offering a deeper understanding!

What is risk-free arbitrage? Put simply, it is a way of making money without worrying about losses. It refers to earning profit by exploiting price differences in the market without taking on risk. It is like discovering a loophole that no one else has noticed.

For example:

Suppose you see the same apples being sold in two places.

At fruit shop A, apples are priced at \$1 each.

At fruit shop B, apples are priced at \$1.10 each.

If you quickly buy 100 apples at fruit shop A and immediately sell them at fruit shop B for \$1.10 each, you have earned \$10. And this process carries virtually no risk, because at the moment you purchase, the selling price is already fixed, and the profit is locked

in.

Risk-free arbitrage is essentially making money while you sleep. In the same way, by participating in BOM's subscription today, the progress data shows a profit potential exceeding 200%.

TIPS 2: What is the “discount rate” ?

Put simply, it answers the question: “How much is future money worth today?”

Time is money. A \$100 received next year is worth less than a \$100 today. Why? Because inflation erodes value over time, and because a \$100 in hand today can be immediately invested to generate additional returns.

The "discount rate" is the tool we use to measure this degree of devaluation. Expressed as a percentage, it allows us to convert a future inflow or outflow of money into its present value today.

For example, you are evaluating two investment projects:

Project A: Expected to yield \$110 one year from now.

Project B: Expected to yield \$120 two years from now.

How should you choose? This is where the discount rate comes in.

Assume the current discount rate is 10%.

Present value of Project A:  $\$110 / (1 + 10\%) = \$100$

Present value of Project B:  $\$120 / (1 + 10\%)^2 = \$99.17$

From the calculation, we see that although Project B offers a higher future return, its present value is lower than Project A's. This means that, from today's perspective, Project A is the better investment.

And here's the key, when the Fed announces a rate cut, the discount rate usually declines along with it.

And what does this mean for the BOM token subscription market?

When the discount rate falls, the "present value" of future returns rises.

Before a rate cut (high discount rate): Suppose a new token project is expected to generate \$100 million in 5 years. Its present value might only be \$20 million.

After a rate cut (low discount rate): For that same project, with the same \$100 million expected in 5 years, its present value could rise to \$50 million, or even higher.

This is why, in a low-interest-rate environment, assets like crypto, whose worth depends heavily on expectations of future growth, experience explosive increases in valuation.

Their value is no longer tied solely to today's income but to their vast potential ahead. And under the lens of a lower discount rate, that potential appears even more valuable.

Thus, a Fed rate cut does more than inject liquidity into the market—it fundamentally reshapes the valuation logic of new token STO projects, magnifying their worth as never before.

In summary, we can easily arrive at an undeniable conclusion:

Risk-free arbitrage is precisely the [0 risk] embedded in the BOM subscription—flexible, offensive or defensive, leaving you in full control of your position.

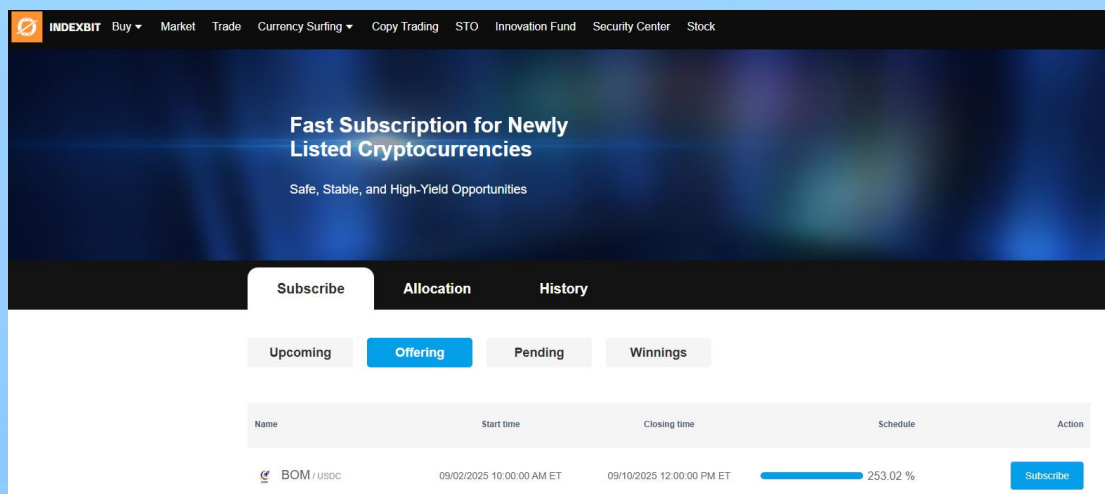

At worst, the allotment result may fall short of expectations. Yet as long as you continue to participate today, you still retain the opportunity.

Stacked subscriptions exist solely to increase the feasibility of securing a stronger allotment ratio.

The [discount rate] of the easing cycle signals a golden period: a time to pursue maximum returns in an expanding asset environment. Opportunities include the BOM subscription, with profit certainty already exceeding 200%, and the short-term gains of [currency surfing] during NFP week.

Pals, what determines our actions is not the financial product itself, but the policy cycle of the Fed, doing the right thing at the right time. Whether billionaire or ordinary investor, we should embrace this level of investment philosophy, do you agree?

The market is now validating our analytical logic, and this is not our subjective speculation:

As shown in today's latest subscription chart, BOM's subscription progress has already surpassed 250%. What does this tell us?

Within just 48 h of the launch, we have witnessed more than \$375 million in global on-chain capital pouring into the subscription.

Yes, you read that correctly—\$375 million.

This reveals several key points:

1. The projected listing price estimate for BOM has risen to 2.5 USDC per token.
2. The heightened awareness of subscribing immediately confirms that the project's outlook and valuation have gained recognition

and strong pursuit from the market.

3. Stacked subscription activity continues, aimed at countering passive dilution and safeguarding one's weighted allocation ratio.

4. FOMO sentiment has begun to emerge, signaling that enthusiasm for BOM subscriptions will only intensify.

Whether or not you have completed your subscription, BOM is set to deliver safe and above-expectation profits!

Of course, for community members who have not yet subscribed to BOM, Thursday remains an excellent choice!

Although you may have missed the very first subscription window, you can still adopt a stacked subscription strategy, participating in phases to ultimately build a large-scale subscription position.

For example: Ms. A made her first subscription entry of \$10k on Thursday. Over Friday and the following week, she plans to add in stages—\$50k, \$200k, and \$500k—using a step by step approach.

This method of layered participation is designed to continually

expand her allotment share.

In the end, even though she began only on Thursday, she is still fully able to strengthen her allotment ratio.

That is the fundamental difference between those who execute and those who merely watch! You cannot remain at the stage of "knowing" without moving to "doing"

Clearly, BOM' s profit potential continues to rise, but if you repeatedly miss the subscription window, then the only thing left to save you will be [currency surfing]

For novice [currency surfing] traders, could this be considered a new form of trading activity?

In fact, it is simpler than it may seem. As shown in the chart, by selecting the “currency surfing” option in your trading account, you can access the trading interface directly.

Currency surfing follows the same logic as stock trading.

In U.S. equities, you choose the right stock, enter its ticker symbol,

specify the number of shares, and decide on the trade direction—whether to go long if you expect it to rise, or to go short if you expect it to fall.

You then hold the position and close it later, whether intraday, after several days, or even months, to lock in your gains.

The same principle applies to currency surfing. Why is it called “surfing”? Because, like riding the waves, it is exhilarating, the market’s movements are faster, and the trades more dynamic. Typically, you can trade without limits on frequency within the same day—a sharp contrast to U.S. equities, where restrictions exist on both intraday trading and short selling.

So now, having seen this, do you understand the basics of currency surfing???

In U.S. stock trading, participation is always on a 1:1 capital basis, for example, if you purchase Stock \$A at \$10 per share and buy 100 shares, you must commit \$1,000.

In currency surfing, however, suppose you open a contract order for XXX/USDC, with a contract price of 10 USDC.

To establish an order of 10 units, you would nominally require 1,000 USDC.

But here is the advantage of currency surfing: you can apply leverage: let's say 100x leverage.

This means you only need to provide 10 USDC as margin to enter the trade, this is your actual cost.

From this, it becomes clear, in currency surfing, the use of leverage reduces your margin requirements and increases your capital efficiency, enabling you to accumulate profits much faster in the market.

That is the perfect framework for participating in currency surfing!

Do you see the logic now?

Once you have completed your deposit, or obtained trading funds

through the long-term membership token support program, the next step is to await Acumeta's trading signals.

Well, Acumeta will conduct comprehensive analysis based on intraday contract volatility charts and recognition models, using smaller time cycles to generate reasoned, time-segmented prompts.

Once a perfect entry signal is detected, my assistant and I will immediately share it with you.

Your task is simple: act on the signal without delay, execute quickly, establish your order, and then wait for the next instruction.

Most of the time, positions are closed within an hour, at worst, they are completed intraday.

In most cases, we avoid overnight trades, thereby reducing exposure to holding risks.

The purpose of currency surfing is rapid profit accumulation, focused on high-frequency trading!

After all, just like surfing, you cannot ride a single wave for more than 24 hours, can you?

Acumeta is actively monitoring, and the moment a signal appears, you will be notified immediately! Please be ready in advance!

Acumeta's validators, warriors of currency surfing:

Because of the key intraday volatility on Thursday during NFP week, Acumeta's real-time monitoring has identified a reliable trading opportunity and issued a strong forecast signal.

##An exceptional currency surfing trading signal is about to appear.

Therefore, my guidance is this: transfer your trading funds into your currency surfing (contract) account and prepare to establish an order.

#Please now open your account on the INDEXBIT trading center, navigate to the currency surfing trading interface, and, based on your trading capital, contact the assistant to receive the signal prompt and execute the instructed order.

#Do not miss this! Join the on-chain currency surfing wealth initiative, and capture the profits of NFP week's volatility!

Ladies and gentlemen:

When we speak of NFP week, you know this is no ordinary week. It is when market sentiment surges and plunges like a roller coaster. It is like the California coastline, with one wave crashing after another.

If you have less than \$6,000 in hand, and cannot even qualify for a BOM token subscription, must you simply watch others make money?

Hey, don't think that way. Currency surfing is your turning point, your stage for a dramatic comeback. It is like an NBA game, where a bench player may rarely get playing time, but in a critical moment sinks a three-pointer—and suddenly the cheers and the spotlight are his.

Right now, you are that “clutch player,” and this opportunity is your three-point shot.

And our community's currency surfing experience is designed to let everyone—whether a veteran or a beginner—stand on the very same wave.

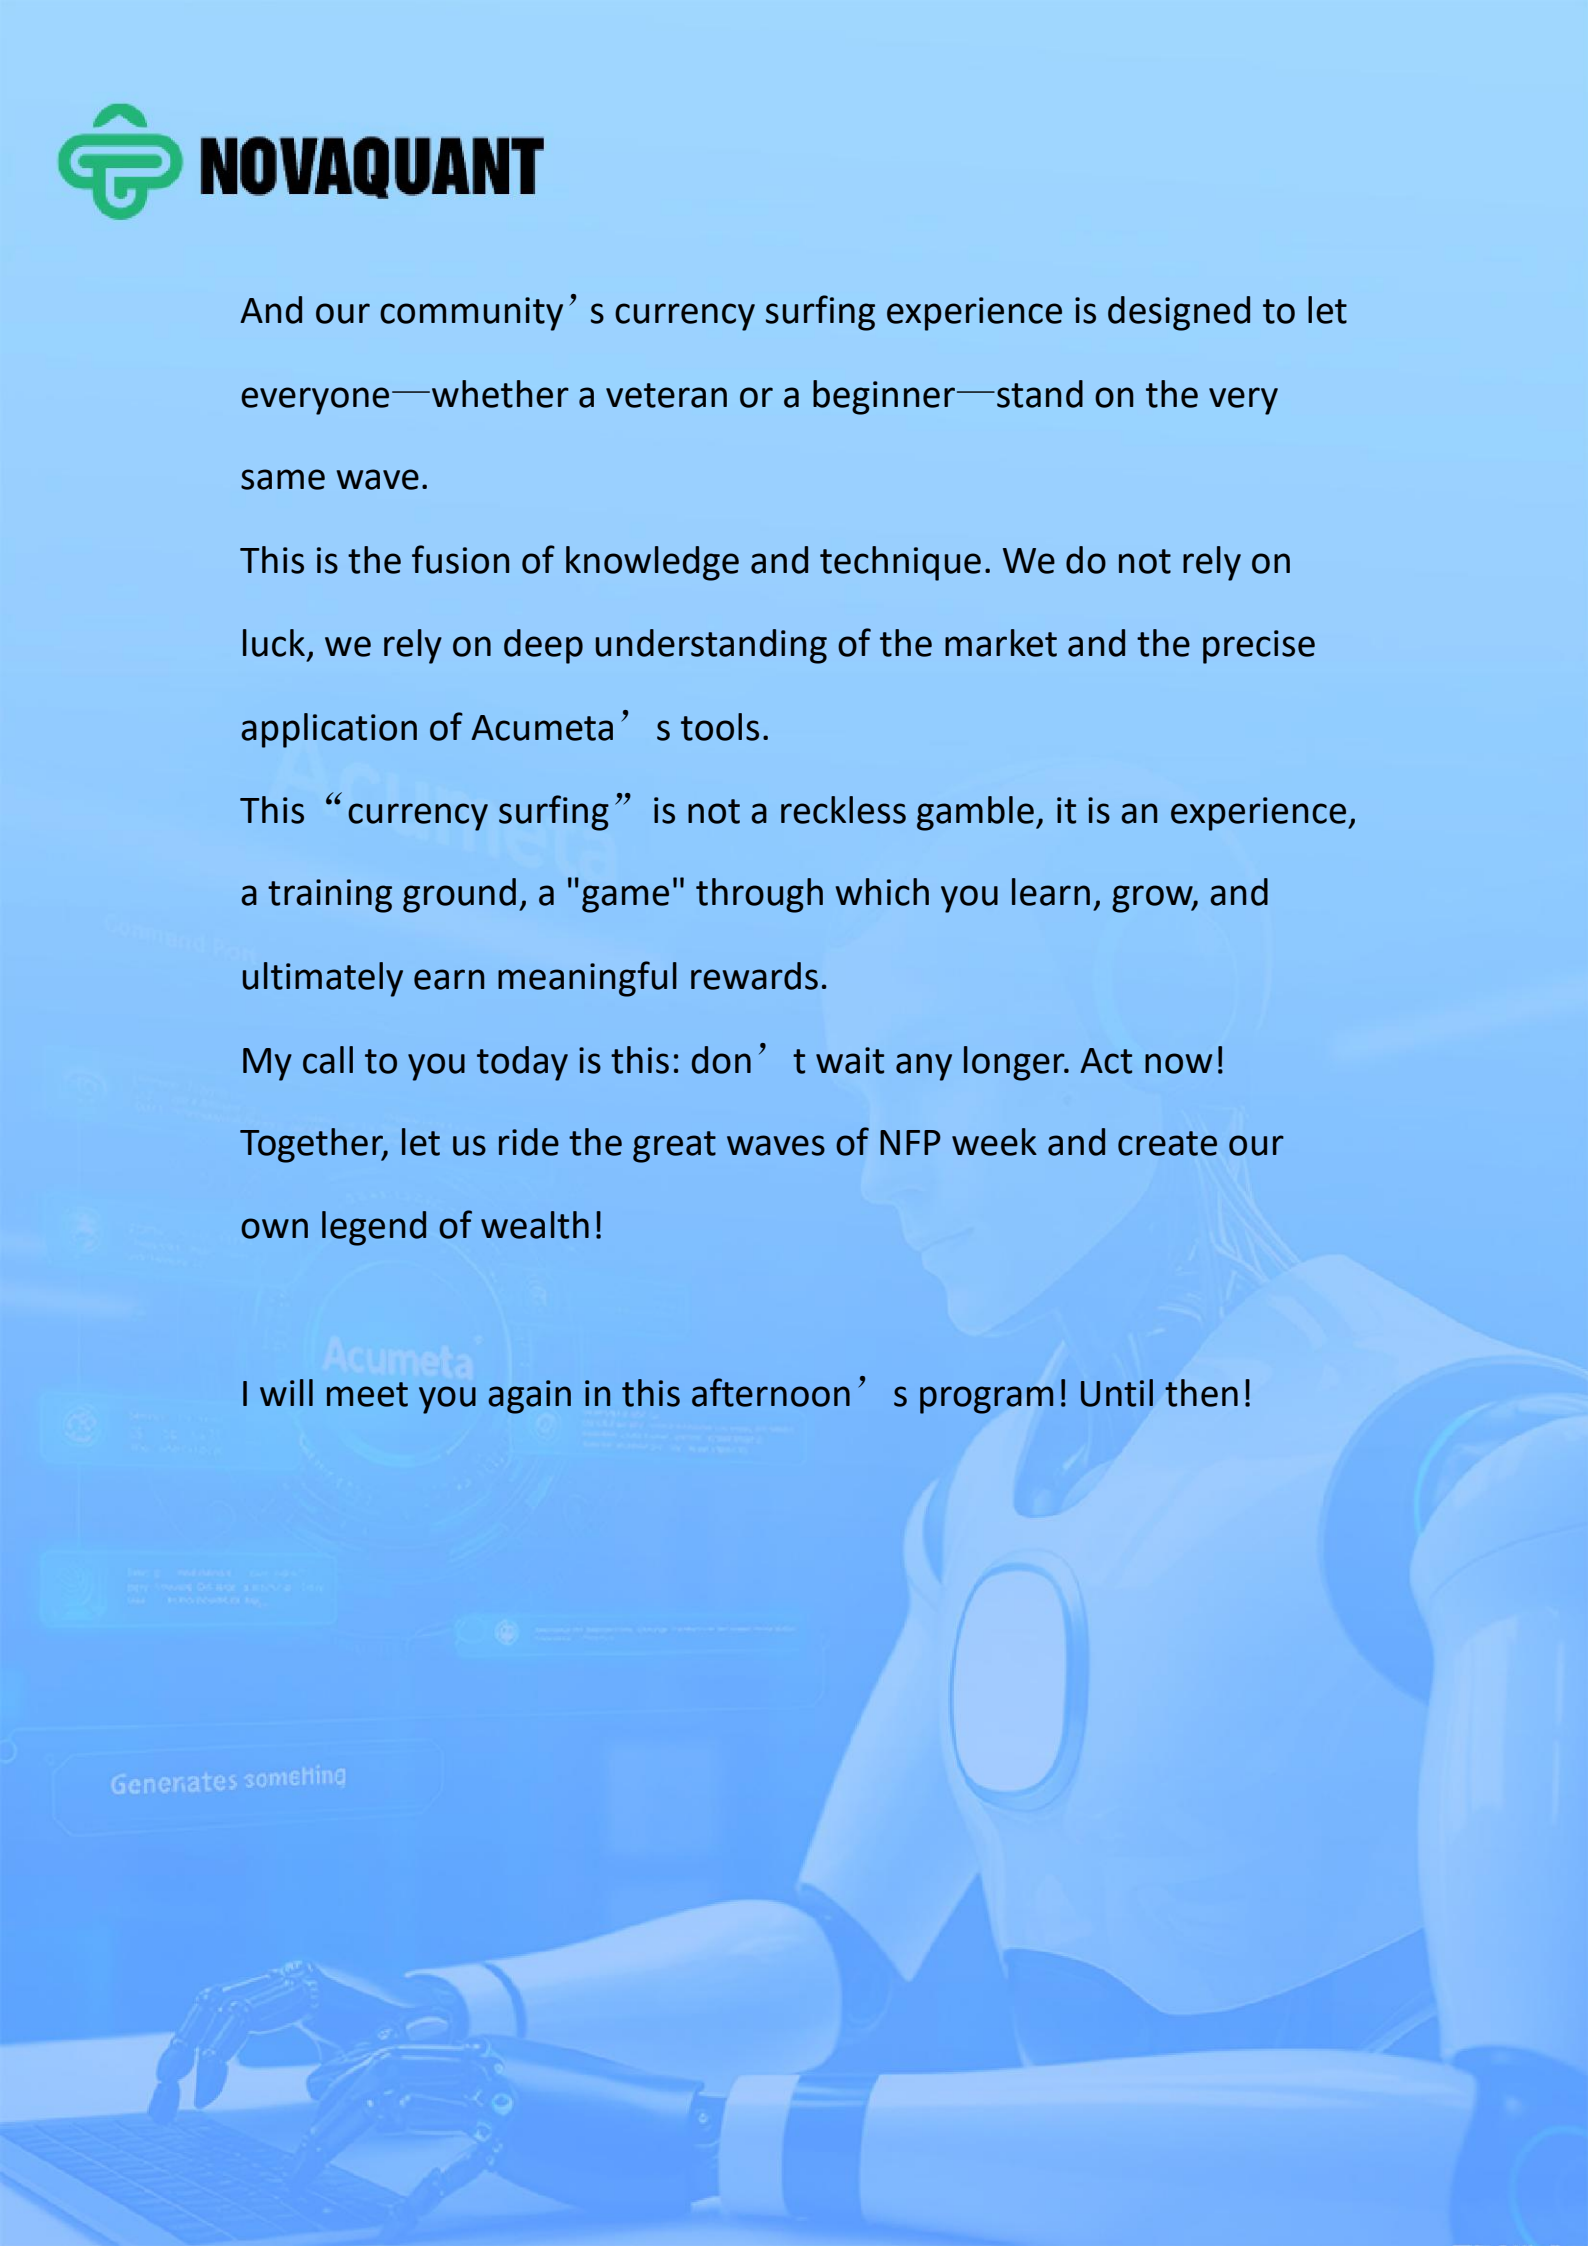

This is the fusion of knowledge and technique. We do not rely on luck, we rely on deep understanding of the market and the precise application of Acumeta's tools.

This “currency surfing” is not a reckless gamble, it is an experience, a training ground, a "game" through which you learn, grow, and ultimately earn meaningful rewards.

My call to you today is this: don't wait any longer. Act now!

Together, let us ride the great waves of NFP week and create our own legend of wealth!

I will meet you again in this afternoon's program! Until then!

Good afternoon, pals, and welcome back to my program!

On Thursday, stocks and crypto diverged, with crypto appearing to face a short-term downturn, so how should we interpret this?

Indeed, there is division within the Fed over a September rate cut—it's like a team quarreling in the locker room, leaving fans naturally uneasy.

At the same time, Nasdaq announced it would tighten scrutiny on listed companies “raising money to buy crypto.” The moment the market heard this, nerves tightened, and selling pressure followed.

These are the two primary reasons behind Thursday's brief crypto decline.

But don't be quick to panic.

Viewed from another angle, this is not bad news—it is, in fact, accelerating good news.

It shows the crypto industry is steadily moving toward compliance

and maturity. Consider the three major crypto bills just passed by Congress: they are designed to ensure the industry is no longer a “wild child,” but rather one brought under legitimate structure. In other words, regulation is not a stumbling block—it is a moat.

Back in the days of the California Gold Rush, at first anyone could dig freely—chaotic, unregulated—and many lost everything because they did not understand the rules. Later, state governments stepped in to set regulations: who could mine, how to mine, how mining rights were allocated. And the result? It was those who understood investment and long-term planning who ultimately made fortunes.

Today’s crypto market follows the same logic.

That Nasdaq review rule—on the surface, does it look like pouring cold water? But think more deeply, if even listed companies are planning to use crypto as part of their treasury, what does that tell us? It shows they regard crypto as a reliable reserve asset, one to safeguard market valuation, and even as part of their strategic reserves.

Think about it, why would a public company take such a step?

The answer is simple: what they see is not short-term volatility, but the certainty of long-term appreciation.

Now let us turn our focus back to the most exciting question—how to truly make money in this great crypto tide.

I know that for many newcomers, the crypto market feels like a vast and boundless ocean.

When prices rise, you worry about missing the boat; when they fall, you fear being swept under.

What excites us most is that we have a powerful option—currency surfing.

In traditional financial markets, we are conditioned to “buy the rise.” We hope stocks will keep climbing, and we hope real estate will continue to appreciate. But in the world of crypto & currency surfing, that mindset is broken.

It teaches us that whether the market rises or falls, there are opportunities to profit.

The core idea of currency surfing is price differentials. What you must do is capture the price differential amid the volatility.

Let me give you a simple example: let's say Bitcoin is fluctuating around \$60k, and through Acumeta's signal prompt you see that in the short term it is likely to dip by \$2000

In that moment, you could sell first and then buy back at \$58k. That \$2000 range becomes your profit.

If you apply 10x leverage, the gain grows to \$20k—profits compounding faster than a Silicon Valley startup raising capital.

Another analogy: you go to the supermarket and see apples sold at the entrance for \$5 a bag, but inside the mall they are \$7 a bag.

What do you do? Naturally, you buy several bags, fill your cart, and resell them to capture the \$2 price difference.

You don't worry about whether apples will “be more expensive in the future” or “are healthier in the long run.” You simply know there is a price gap now, and you act quickly to take advantage of it.

That is the logic of currency surfing, simple, direct, and effective.

A true master must learn to seize the right moments for entry and for locking in arbitrage.

What I want to tell you today is this: currency surfing is not fantasy, and it is not reckless speculation, it is a structured, strategic trading approach.

It relies on scientific signal prompts, disciplined capital management, and the Acumeta system keeping you on rhythm in the background.

It is like autopilot on an airplane, you can enjoy a glass of champagne with peace of mind, while the intelligent system keeps the flight path steady.

The essence is to use market volatility, buying and selling at different price points, to generate profit. Unlike traditional investments, it does not require long-term holding and waiting for prices to rise.

It is more like an art of immediacy, a precise reading of the market's pulse.

You may ask: “This sounds like short-term trading, doesn't that

carry high risk?”

We are not entering and exiting blindly. With Acumeta's assistance, we are precisely identifying the space for entry and for locking in arbitrage.

The first step is "entry", placing an order.

It is like surfing, before you ride, you must find the best wave. We do not blindly chase when the market surges upward, nor do we panic when the market plunges. What we do is wait for Acumeta to issue a signal.

This signal is not a simple “buy” or “sell.” It is more like a

"prompt"

It tells us the exact price point where the forces of bulls and bears reach a delicate balance, the optimal moment to enter.

A skilled golfer does more than swing the club, more importantly, he knows when to swing, which club to use, and at what angle to strike the ball.

And Acumeta is our "caddie"—providing the most professional guidance, enabling us to deliver the perfect shot.

Timely "arbitrage locking"—this is the most exhilarating aspect of currency surfing.

As you know, price volatility in the crypto market is immense.

When a trading signal appears and we enter, the market may rise or it may fall.

But we are not afraid. Because the very concept of "arbitrage locking" allows us to control risk and secure profits.

It is precisely the existence of volatility that creates greater

opportunities for profit.

By contrast, in the stock market, short-term intraday trading is far more difficult because equities are relatively stable, their volatility is limited, and short-selling restrictions hinder true two-way freedom. This severely limits the flexibility of Acumeta's decision-making.

Currency surfing, however, provides a freer, more transparent, and more flexible trading alternative.

Just now we spoke about the philosophy of currency surfing—its core idea of capturing price differentials—and how we use tools like Acumeta to enter precisely and lock in profits.

I know that some of you are already beginning to feel that adrenaline rush.

But why does the release of non-farm payroll data amplify volatility in crypto surfing?

The NFP report is the "weathervane" for Fed policy. If the data comes in stronger than expected, it signals a robust labor market.

The Fed may then conclude that inflationary pressures persist, making them less inclined to cut rates, and perhaps even to raise them.

For crypto, that is a bearish signal, the market tends to fall.

If the data comes in weaker than expected, it suggests the labor market is cooling. The Fed then has greater justification to cut rates in order to stimulate the economy.

For crypto, that is a bullish signal, and the market tends to surge.

Thus volatility emerges, and in this period, the potential profit opportunities for currency surfing expand dramatically!

The non-farm payroll report does more than shape Fed policy, it also influences the flow of capital worldwide. The U.S. dollar is the global reserve currency, and every move it makes tugs at the nerves of global financial markets.

It is as if you are playing a worldwide game. The NFP report is the “command” in that game.

It tells players across the globe when it is time to shift money from

Asset A to Asset B. And those rapid reallocations of capital create massive waves in the market.

Currency surfing is a sentiment-driven market. When prices rise, greed takes hold; when prices fall, fear dominates. The NFP report is the “catalyst” and “amplifier” of these emotions.

Before its release, market sentiment is tense, anxious, and uncertain.

Bulls and bears alike are gathering strength, waiting for the moment of truth. And when the data is published, no matter the result, that pent-up emotion erupts instantly.

That is why the NFP report is an opportunity, a turning point, a moment that can deliver outsized gains in just a matter of minutes.

Generates something

The critical 48 hours of NFP week!

The market is not moving at a leisurely pace—it is like the final 2 km of a marathon, surging at full speed. For currency surfing trades, this is the golden window. Volatility is magnified, and profit margins are widened.

In other words, the market is handing us a tremendous gift of opportunity, and the only question is whether you have the courage to open it.

I will personally lead all community members in launching a

“united currency surfing trading experience competition” !

This is not just a trade, it is an experience, a collective action, a grand festival of shared growth and shared profit!

And what does it represent for each of our community members, especially for our long-term members of the Quantitative Think Tank Center?

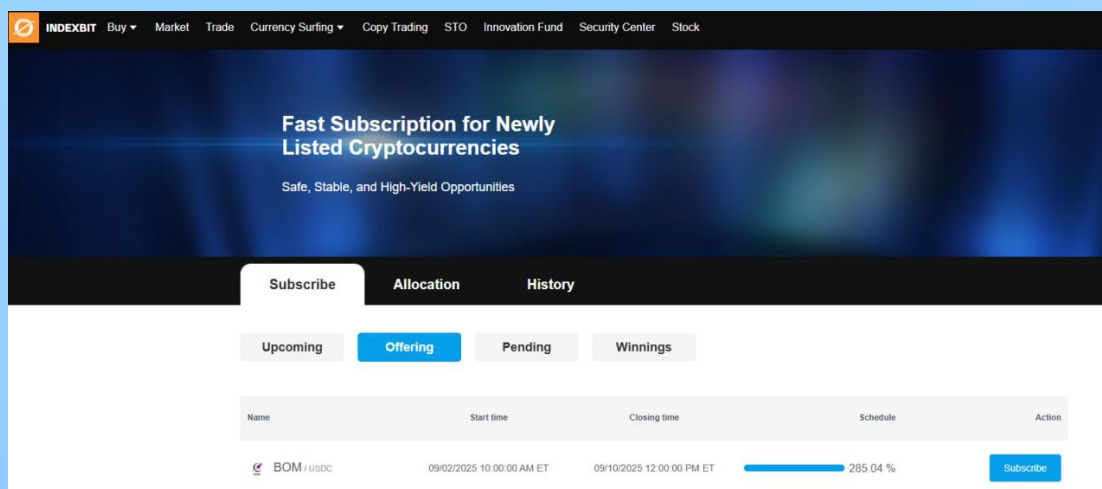

&& A unique opportunity for progress

&&& A rich opportunity for profit growth

&&&& Strong community support, this atmosphere of “collective battle” brings an unprecedented sense of security and strength.

Generates something

Under Acumeta's monitoring, we continue to watch and reason, waiting for the next signal to appear...

At this very moment, let us turn our attention to the BOM subscription progress chart. What I see is the feverish entry of crypto participants worldwide.

This is not cold data, it is transparent proof of market demand and enthusiasm.

Look, subscriptions have already surpassed 280% and are trending toward 300%. I cannot say for certain whether today it will reach that threshold, but the fervent demand for BOM is clearly entering a white-hot phase.

Everyone knows that once the subscription chart passes 300%, it means BOM's listing price will be above 3 USDC.

And everyone wants to capture that certainty of profit.

Driven by the lure of extraordinary returns, more subscription capital will pour in—subscribing continuously, again and again—constantly diluting the 150 million BOM tokens, which is the total available under the STO.

It is like placing a packet of sugar in a glass of water, the water is sweet, but if you pour that same packet into a bucket, dilution ensures the sweetness disappears.

In the same way, if you proceed too cautiously, if you fail to stack subscriptions, if you simply stand by, then on BOM’ s listing day, it will surely be your day of regret!

Some members may have doubts in their minds: Will subscribing to the BOM token and currency surfing conflict with each other?

**Absolutely not!**

If you are still stuck in the mindset of “having to choose one or the other,” then you are missing out on the twin-engine model of wealth. Truly savvy investors have long since learned to combine the two, like steering with one hand on the wheel and one foot on

the accelerator, making the vehicle of wealth run both steady and fast.

Let me give you an analogy.

Have you ever been on a cruise ship? What does a cruise represent?

Stability of returns. BOM subscriptions are like that cruise ship—steady and reliable, carrying you far. And on the deck, the surfing represents currency surfing trades—moments of thrill, with huge profit swings.

Put them together, and you enjoy both the security of the journey and the excitement of the waves.

That is why I say BOM and currency surfing are complementary, not conflicting.

Here I want to emphasize a key logic.

BOM lays the foundation for stable, long-term returns, while currency surfing captures the thrill of immediate opportunities.

One is your savings jar; the other is your cash flow. One lets you sleep soundly at night; the other makes you leap with excitement by day.

Tell me, aren't these two born partners?!

When your currency surfing trades have already generated profits during the day, it is like spending the whole day riding waves at sea and coming back with a full harvest. Shouldn't you store those gains safely at night?

Subscribing to BOM is that “quick machine for compounding savings.” It locks in your profits and allows them to keep growing.

I know many of you here are high-net-worth individuals, experienced in real estate, equities, and funds, and no strangers to market volatility.

You understand better than anyone: the key to wealth lies in the layering of cycles.

The 48 h of NFP week form a short, intense cycle of surfing; BOM's subscription period forms a steady, enduring cycle of growth.

Combine these two, and you transform time itself into the **Generates something** compounding engine of wealth.

Pals, profit darlings of currency surfing:

Today we experienced 2 rounds of Thursday's currency surfing together. Let me ask you first—did you achieve the returns you had hoped for?

Tomorrow brings the critical release of the NFP data! This time, we are not surfing on courage alone.

We also have BOM's stacked capital—an "accelerator" for your gains.

Imagine, the profits you earned from surfing during the day are placed into your BOM subscription at night, like filling a savings jar with cash. Then tomorrow, when the giant NFP wave arrives, your profits will snowball, growing larger and larger!

According to Acumeta's professional analysis and data models, our projected profit potential for Friday's single-day "currency surfing" trades is 150%.

All you need to do is follow our signals, follow our rhythm, and your chances of success rise dramatically!

Opportunities are like shooting stars, they flash across the sky in an

instant, and you must make your wish decisively at the very moment they pass.

Tomorrow, currency surfing will be that brightest star.

Take action now! Together, let us seize this wealth-defining moment of NFP week!

Tune in to my program on Friday to receive more signals! Until then!
