NOVAQUANT

Witnesses of history, beneficiaries of currency surfing:

Wednesday: the Federal Reserve’s day of decision, the turning point for our wealth!

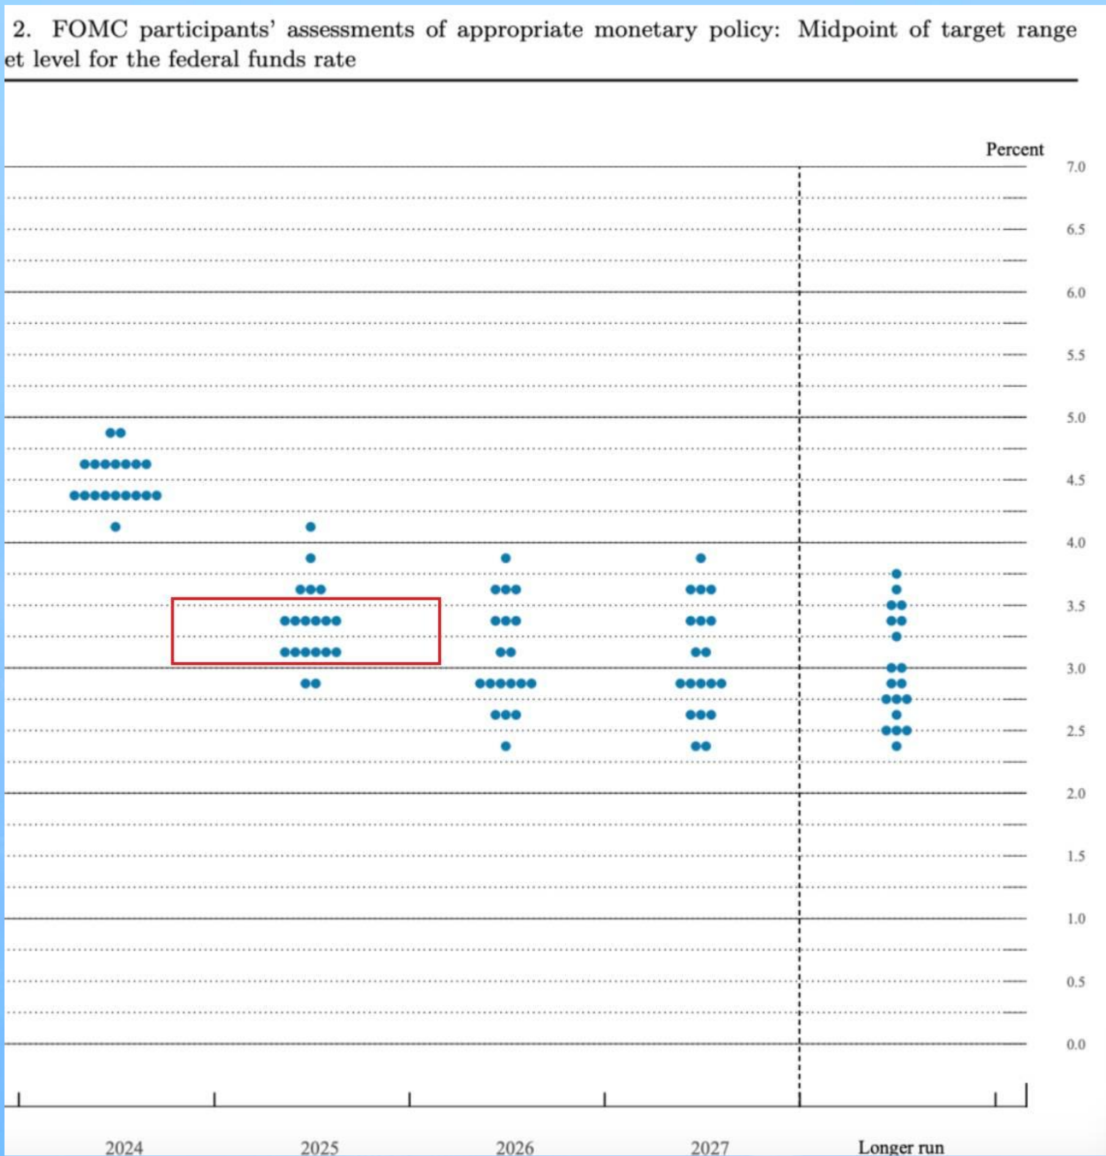
We gather again, not to celebrate, but to embrace a moment that truly belongs to us—a historic moment!

I see the spark of excitement in your eyes; I see the joy upon your faces. Because you know, today is the Wednesday that draws the world’s attention, the day when all eyes are fixed on the Federal Reserve!

This day is not only Wall Street’s main event—it is the moment that quickens the heartbeat of investors around the globe. You may ask, what is the true meaning of this day?

Is it merely about a single interest rate figure? No, pals, it is far more than that, it is a reshuffling of the entire wealth landscape—a super opportunity for our currency surfing strategy, with potential returns of more than 700%!

The Fed’s decision at 2 p.m. will be the "fuse" that ignites our wealth. It will unleash an unprecedented "tsunami," and we will be the elite surfers riding atop its waves!



2. FOMC participants' assessments of appropriate monetary policy: Midpoint of target range
et level for the federal funds rate

Today is not the only good moment to invest, but today does determine the trajectory of every day to come. It is like the kickoff at the Super Bowl—not the only scoring opportunity in the game, but the moment that often sets the pace and the atmosphere. The Fed’s decision at 2 p.m. today will resound like a thunderclap, redirecting the global flood of capital into different asset markets, and currency surfing is the most dazzling crest of that wave!

Personally, I believe the likelihood of a 50 bp cut is very high.

Why? Because the weakness in employment data has already made the market feel the cold touch of recession, and the decline in consumer confidence has left policymakers with no choice but to act quickly to "put out the fire." At such a time, a 25 bp cut is like offering a glass of warm water to a fever patient, while a 50 bp cut is more like delivering an immediate injection to bring down the fever.

The essence of currency surfing is not betting on one-sided market rallies, but riding the rhythm of volatility to harvest profits. Whether the Fed loosens or tightens, as long as volatility exists, we can carve out returns. And at such a historic juncture, volatility does not merely exist—it is immense!

Today's potential return of more than 700% is no fantasy, it is the ultimate expression of currency surfing's ability to harness volatility to the fullest.

Today is truly a day when the entire global financial market holds its breath!

Because at last, the Fed will reveal its hand. Will it be a 25 bp cut? Or a bold move straight to 50 bp? Do not underestimate the difference of just 25 bp, market sentiment, asset prices, capital flows, and even the money in ordinary people’s wallets could all undergo seismic change because of that small shift. Not to mention the possibility of 2, or even 3, additional cuts signaled before year-end—that would be the true "secret code" determining the direction of wealth in the year ahead.

In the markets, real opportunities do not appear every day; they concentrate in those few moments that make the heart race. Today is such a moment!

If the Fed really opts for a 50 bp cut, it would be the equivalent of pressing the "market frenzy" button. And if it also signals 3 future cuts, it would be like igniting a "chain of explosives," driving volatility to its maximum. For those of us who understand currency surfing, this is the wave of wealth!

NOVAQUANT

What would it mean if Powell were to signal 3 rate cuts by year-end today?

It is not merely a simple number, it is a matter that touches every one of our wallets! It is like a magician waving his wand, and suddenly, our money has quietly "shrunk."

When the Fed cuts rates 3 times, the dollar’s value falls as supply outstrips demand. And when the dollar depreciates, the purchasing power in every one of our wallets falls with it.

It is as if the $100 you worked so hard to earn could buy a bicycle today, but tomorrow it might only buy a single bicycle wheel. Would you willingly watch your wealth shrink away? Of course not. No one would, but the reality is that harsh. When currency depreciates, all of our wallets begin to "leak air" in silence. The money you worked so hard to earn may look the same on the surface, but in truth, it has already become lighter.

That is why, in moments like this, we must be clearer, more decisive than others. Inflation is not some abstract economic term—it is when you notice the price of milk has gone up at the grocery store; it is when you discover your rent is 10% higher than last year. You think it is just prices rising, but in fact, it is the currency that is falling in value.

In the game of wealth migration, the key is to stand on the right side.

Money never disappears, it simply flows from one place to another, from those who fail to see the trend and react slowly, to those who plan ahead and dare to act.

The essence of making money has never been magic—it is a transfer of wealth.

Just as the Bible says, God helps those who use wisdom to make decisions.

Inflation is like a silent flood. You may not see it, but it rises a little higher every day. If you remain where you are, the water will cover your ankles, then your knees, until finally you are submerged. But what if you had a boat? Then you could go with the current, and even use the flood to reach places others cannot. Friends, currency surfing is that boat, and the volatility brought by rate cuts is that flood. The only question is—do you dare to get on board?

Money will become less and less valuable, and prices will continue to rise. If you simply sit on cash and do nothing, you are waiting for your wealth to be quietly stolen. But if you can make good use of the surfing strategy and capture the market volatility that follows rate cuts, then you can stand on the right side of the wealth migration.

For many, the very thought of market volatility provokes fear—that perhaps the risk is simply too great.

But friends, risk has never been the real problem—the question is whether you have a method to manage it.

It is the same in currency surfing: knowing how to diversify positions, how to add to positions, and how to follow the trend is what allows risk to be transformed into opportunity.

If by year’s end there truly are 3 rate cuts, then the backdrop for the next year is already set: the dollar will depreciate, prices will rise, and asset markets will experience sharp volatility. And the only real question is whether we can carve out our own space for profit within that volatility. Money never sleeps, it is always searching for its next destination. And today is the moment for you to prove your intelligence and decisiveness.

Do not fear inflation— take it as the signal guiding wealth’s migration; do not fear rate cuts—embrace them as the surging waves to ride. Do not fear volatility—accept it as the gift of profit.

Last year, on September 18, the Fed made a rate-cut decision. That very day, Bitcoin's price shot up from $59,000 to $61,000. And do you know what happened next? The following day, it surged again, breaking through to $63,000.

In just two days, the gain exceeded 5%.

Some might say, a 5% increase doesn't sound too dramatic. But let me tell you—when an asset like Bitcoin moves 5%, it is not a trivial percentage, it means the global market capitalization swelled by as much as $100 billion. In just 48 hours, capital from all directions poured into the Bitcoin market. This is the direct effect of a rate cut: money seeks an outlet, capital looks for a refuge, and Bitcoin becomes the chosen "safe harbor"

Looking further at the trend that followed, as the path of rate cuts continued, Bitcoin's price broke all the way through the $100,000 threshold.

Fellow investors, this is not a speculator's game—it is a genuine migration of wealth.

In that moment, everyone who had the courage to board early was enjoying a view that others had already missed.

What is different about where we stand today compared with last year? The answer is that the market is larger, the volatility greater, and capital more impatient.

What remains the same is that the Fed is still using rate cuts to push liquidity, and that wave of liquidity will still surge into the crypto market.

On September 18 last year, when the Fed announced its rate-cut decision, the .SPX fell from 5,690 points all the way down to 5,600. Many believed that rate cuts would surely ignite a fiery rally in equities. Reality, however, dealt a harsh blow: instead of rising, the market closed lower. Hidden in this was a massive signal of wealth migration.

Because a falling stock market does not mean money has disappeared. Money never evaporates, it simply shifts direction quietly. Where did the funds flowing out of equities go? Part went into bonds, and another part flowed into the on-chain world of crypto. You must understand, every major policy inflection point brings with it a great migration of wealth. The question is—are you standing on the right side of it?

And when you hold more cash in your hands, you suddenly realize that behind this "sense of security" lies another layer of concern. More cash, yet the dollar is depreciating. Purchasing power is steadily slipping away. Today, a hundred dollars cannot buy what a hundred dollars bought last year. This is the cruel reality of inflation. No matter how safe you feel, you cannot escape the erosion of money shrinking in your hands.

The answer is to move funds on-chain, to recharge wealth into the world of crypto, and to take part in this era’s currency surfing. This is not only a way to counter the dollar’s depreciation, but also to stand squarely in the main channel of wealth migration.

Why has the stock market failed to rise, while Bitcoin has surged? The answer is simple. The stock market is the game of "old money," constrained by economic cycles, corporate earnings, and regulatory policy. Bitcoin, by contrast, is the destination of "new money." It does not depend on the quarterly report of any CEO—it is the purest receiver of global liquidity. Every rate cut, every expansion of dollar liquidity, inevitably drives part of that capital to seek an outlet on-chain.

Do not forget, cash is only a temporary sense of security, while on-chain assets are the true long-term moat. The dollar is depreciating, inflation is eroding, and the traditional markets have fewer and fewer surprises to offer. Only crypto, only currency surfing, is the inevitable trend of wealth flow in this era.

You are the most perceptive observers of this era, the bravest wave-riders in the tide of wealth.

In your investment portfolios, there may be traditional stocks and bonds, perhaps rare artworks or real estate.

But we are not here to talk about those familiar, timeworn topics. What we are here to discuss is something happening right now—an epic transfer of wealth powerful enough to overturn everything we thought we knew!

Just today, inside the U.S. Congress, that gray building often seen as stodgy and inefficient, an event of historic significance took place: the advancement meeting for Bitcoin strategic reserve legislation. Why does this matter? Because it is not an isolated occurrence, it comes at an unprecedentedly "coincidental" moment—the very day of the Fed’s rate-cut decision.

That means another flood of dollars will be unleashed, and the money in your savings account will melt away like ice cream.

Meanwhile, Congress is debating whether to elevate Bitcoin to the same level as gold as a strategic reserve asset. They are not fools, they understand all too well that at a time when the dollar’s credibility is under strain and the global economic order is shifting, America needs a "new anchor". And that "new anchor" they have chosen, without hesitation, is Bitcoin!

In the next 5 years, the U.S. government will become the largest "whale" of Bitcoin.

How much do they intend to acquire? 1,000,000 coins!

How much do they currently hold? 200,000!

What’s the shortfall? 800,000!

This is no small figure—it amounts to nearly 4% of the total global supply of Bitcoin!

Where will they get that kind of money? From U.S. Treasuries! They will issue $100 billion in Treasury bonds, and then use those funds to rush into the market— competing with us, with you, with investors all over the world—to buy up Bitcoin!

It is like a robbery announced in advance, except what’s being stolen is not your wallet, but your trust in the traditional financial system. And it is like a grand celebration, except that only those who arrive early will get to drink the sweetest champagne.

Do not forget, history has a remarkable way of repeating itself. In 1933, President Roosevelt signed the «Gold Reserve Act», requiring U.S. citizens to surrender their gold. What was the backdrop then? The Great Depression. And what did people think at the time? "The government has gone mad! Isn’t this robbery?"

But the fact is, that action stabilized America’s financial system and laid the foundation for the subsequent economic recovery.

What we are facing is the "Great Depression" of the digital age—an unprecedented debt crisis, geopolitical conflict, and the collapse of trust in traditional currencies. And Bitcoin is the "digital gold" being used to confront this crisis.

It is like a race, the starting gun has already been fired, and the U.S.

government—the largest whale—has jumped into the water, signaling through its actions that the next frontier of wealth growth lies here!

I am not a Bitcoin zealot, I am simply a rational observer.

What I see is this: when the most conservative and traditional institutions begin to embrace something new, the trend it represents is already irreversible.

The U.S. government has not yet begun large-scale purchases! The shortfall of 800,000 coins means they must keep buying consistently in order to complete their strategic reserve. This implies that over the next 5 years, Bitcoin’s demand side will have a massive, immovable foundation of support.

Bitcoin will be incorporated into the national strategic reserve alongside gold, enjoying equal status. This is a signal that could not be clearer: the direction of wealth migration is already written in black and white.

At 2:30 p.m., the Fed’s rate-cut decision will send a signal to investors worldwide about the shifting tides of wealth;

We must understand one thing: when a nation-state makes its move, the rules of the market change completely. The U.S. government’s purchases are not the scattered buys of retail investors, nor the maneuvers of a few hedge funds—they represent the participation of the state machine itself.

This means that Bitcoin will no longer be merely an "alternative asset"; it will become part of national strategy. In the next 5 years, the U.S. government will be the dominant player, and all retail and institutional investors alike will be swept into this wave.

The combination of a rate cut and Bitcoin reserve legislation forms a dual signal. Rate cuts bring dollar depreciation and liquidity flooding the system, while Congress’s actions provide capital with a clear outlet and direction. Money is flowing out of equities and bonds, and ultimately into the pool of crypto. The direction of wealth is on-chain; the strategy of wealth is in Bitcoin.

What you must do is not to doubt, not to sit on the sidelines, but to take the bold step forward.

On rate-cut day, Acumeta’s trading signals will continue to be released. Please follow updates from my assistant and stay engaged in currency surfing trades, this is your best moment to compound profits. See you this afternoon!

Witnesses of the Fed’s rate-cut day, the surfers of currency waves:

Today we arrive at a moment destined to be recorded in financial history. The Federal Reserve has just announced a 25 bp cut—a result widely anticipated and already priced in by Wall Street. But let me tell you, what truly deserves attention is not today’s 25 bp, but the potential for at least another 50 bp of cuts by year-end.

Do you know what this means? It is not a simple numbers game of interest rates, it is a reshuffling of the market landscape, a fresh start for the path of wealth migration.

In recent years, the Fed’ s focus was all on "inflation expectations." They stared at price indexes as though the fate of the entire nation depended on the price of a basket of eggs or a gallon of milk. But today, we see a major shift—they have turned their focus to "employment data." This is no minor technical detail; it signals a change in policy logic: from managing prices to safeguarding jobs, from "concern over inflation" to "fearing a hard landing for the economy."

In other words, the wind has shifted, and trading logic must shift with it

How can we make sense of the Fed’ s interest rate shift in layman’ s terms?

In the past, the Fed resembled a fitness coach obsessed with the scale—tracking daily whether you had gained or lost weight, even if the change came only from an extra glass of water. But today, it is more like a professional trainer who cares less about your pounds and ounces, and more about whether you can finish the full marathon.

For the markets, this is the signal: future interest rate policy will no longer be only about "suppressing inflation," but about "supporting employment" and holding up the broader economy.

Doesn’t that shift in logic create enormous investment opportunities? When policy moves from obsessing over prices to focusing on jobs, it means liquidity will flow into markets faster and more forcefully.

For us, the participants in currency surfing, this is nothing short of a dream wave.

Remember when the pandemic first broke out in 2020? At that time, unemployment soared, and the Fed wasted no time cutting rates to 0 while unleashing unlimited QE.

Because the focus of policy had shifted from prices to jobs, the Fed had to keep the economy from collapsing, so they flooded the market with liquidity. In the end, those who caught that wave saw their wealth double or even increase tenfold. Doesn’t today’s situation feel strikingly familiar?

A 25 bp cut is only the prelude, the coming 50 bp cut will be the climax.

Today’s gentle rate reduction may appear mild and painless, but when it compounds and persists, it has the power to redirect trillions of dollars in wealth.

And where will that flow go? It will inevitably move toward the fields with the greatest potential and explosive power. Some will say technology stocks; others will say real estate. But I tell you, the greater answer lies in crypto—for it is both an emerging reservoir of wealth and a new global channel for capital seeking safety.

Many people like to say, "I’ll wait until things are clearer before I enter." But in financial markets, there is never a moment that waits for you. We now stand at a new inflection point: the 25 bp cut is already a reality, and the year-end 50 bp cut is fast approaching.

The style of trading is shifting, and the pathways of wealth migration are being restructured.

NOVAQUANT

This is a new game, a bigger, more exhilarating game, one that demands you break free from old ways of thinking!

This is the era of a great migration of wealth!

When the Fed shifts its focus from "inflation" to "employment," when it no longer worries about the consequences of printing money, when it openly declares its intent to stimulate the economy with rate cuts—we are already standing at history’s crossroads!

At Powell’s press conference, attention centered on the "risk-mitigation rate cut." How should we understand the signal this path of rate cuts conveys?

The so-called "risk-mitigation rate cut" means that the Fed foresees potential economic pressures ahead and, before they erupt fully, opens the pressure valve slightly so that the economy and markets can breathe in more liquidity. It is like driving on the highway, when you see a sharp curve ahead, a smart driver eases off the accelerator early to leave room, rather than slamming on the brakes only when nearly hitting the wall. This kind of rate cut is precautionary—mending the roof before it rains.

Here’s a simple story: a farmer knows there may be a drought this year, so he digs irrigation channels in advance. When the drought does arrive, his crops not only survive but thrive more vigorously than his neighbors’. A risk-mitigation rate cut is the Fed digging those channels, and the crypto market is the field that flourishes because the water is there.

Once the rate-cut path opens, it means the window for wealth migration has already begun. Don’t think this is merely a difference between 25 bp and 50 bp. Behind those numbers lies a longer cycle of liquidity flooding the system—trillions of dollars in search of an outlet. Smart money won’t wait until inflation returns to scramble for assets; it positions early, putting capital into the fields that promise appreciation.

Some may say: "Won’t the stock market rise too?" That’s true—the stock market often rebounds during rate-cut cycles. But the stock market has one problem, it is constrained by corporate earnings and fundamentals. Today, with employment data under pressure and consumption in decline, even a rate cut cannot instantly make every company’s profits surge.

Crypto is different. It is the reservoir of global liquidity. It does not depend on the performance of any single company, so long as capital flows in, prices can be driven directly higher.

Today’s performance in equities only underscores this important point!

In September last year, when the Fed cut rates by 25 bp, Bitcoin jumped from $59k to $61k that very day, then surged to $63k the next day—adding $100 billion in market value in just 48 hours. And as two rate cuts compounded, Bitcoin’s price broke through the $100k mark.

This is the classic path of wealth appreciation: policy window —> liquidity release—> capital flowing into the crypto market —>exponential price rise.

Today, Fed Chair Jerome Powell not only announced the latest progress on rate cuts but also revealed a deeper long-term blueprint: according to the dot plot, by 2026 and 2027 the federal funds rate will gradually be lowered to 3.4% and 3.1%.

Does that sound far away? But don’t forget—the market won’t wait for you. It begins pricing in expectations months or even years in advance.

In other words, the positioning you make today is actually laying the groundwork for a wealth surge in 2026 and 2027.

If, back in 2010, when Bitcoin was worth only a few cents, someone told you it might one day break $60k, would you have laughed at them as a dreamer? Yet the reality is that those who dared to act while others doubted became the legends of wealth creation in the new world.

Today’ s dot plot is in fact such a "wealth code" trailer, reminding you that the dollar will continue to depreciate in the years ahead. And what can truly resist that depreciation, preserving and even growing in value, are crypto assets that embody scarcity, global liquidity, and anti-inflationary properties.

When interest rates fall to 3.4% or even 3.1%, it means the money in your savings account will become increasingly "worth less"

If you simply sit comfortably guarding your bank account, 10 years from now you will find that while the numbers on the page have not changed, your purchasing power has been "quietly stolen". It is like the frog in warm water, by the time you notice, it is already too late. Meanwhile, smart capital has long since moved at the very start of the rate-cut cycle into high-growth, high-resilience assets, securing a position on the future’ s high ground of wealth.

From 2019 to 2021, the Fed’ s ultra-loose policy pushed Bitcoin from $3,000 to $60,000, at the time, many dismissed it as coincidence.

But today, as Powell’s dot plot once again sketches out a "gradual easing path" for the future, shouldn’t we recognize the shadow of history? This is not coincidence, but the inevitability of wealth migration under policy-driven forces.

So how should we act? The answer is not complicated.

1. Maintain liquidity flexibility. This does not mean clinging to dollars, but using cash as chips to position into higher-growth crypto assets.
2. Follow the logic of "dollar depreciation, hard-asset appreciation." Shift part of your portfolio into Bitcoin, Ethereum, and emerging stock-tokenization projects (STOs).
3. Master the strategy of "currency surfing" during rate-cut cycles. Use short-term volatility to capture high-frequency opportunities.

These are the true pathways of the ultimate winners.

The world’ s current of wealth is accelerating its course change.

The dot plot is the modern version of a "treasure map."

It does not give you the exact coordinates of wealth, but it does provide direction: falling interest rates, a weakening dollar, asset revaluation, and wealth migration.

The rest depends on whether you are willing to climb mountains and cross rivers to seek out the treasure.

Of course, in currency surfing, some long-term members may wonder: regarding the IDT/USDC pair, why does Acumeta always seem to monitor a single trading instrument?

First, we must understand the principles behind Acumeta’ s monitoring of the entire crypto market’ s volatility:

1. Among all the monitored assets—thousands or even tens of thousands with price fluctuations—the degree of volatility at any

given moment is not uniform. Hence, what you see is the result of big-data comprehensive analysis and chart-recognition reasoning.

2. When monitoring major assets like Bitcoin and Ethereum, these two serve as the market’s anchoring core. In spot trading, they are highly responsive and function as long-term reserve core assets. However, in contract trading, their high prices make them clearly unsuitable for the general trading requirements of all community long-term members.

Therefore, within an appropriate price range, and with sufficient liquidity and activity, the IDT/USDC pair has become an important target for Acumeta’s trading signals.

The IDT/USDC token contract comes from the INDEXBIT crypto trading center’s own asset. It is much like how the Nasdaq exchange has the Nasdaq Index, or how major trading centers like Binance and OKX issue their own tokens. Whether it’s Binance’s BNB, OKX’s OKB, or Crypto.com’s CRO, they all inevitably launch their own platform tokens. Why? The answer is simple—because this is the most direct link of shared interest between the trading center and its users.

Let’s think about it from another angle. When you walk into a bank, why is the first thing you see the grand marble hall, the orderly counters, and the staff in suits? Because those elements are the bank’ s "representation." They send you a message: this place is safe, this place is trustworthy.

The same logic applies in crypto. If a trading center has no representative image—whether a spokesperson, long-term reputation, or a visible mark of compliance—then to users, it feels like walking into a dimly lit shop and wondering: "Do I really dare to leave my money here?"

The first function of brand representation is to build trust and create a sense of security. As Warren Buffett once said: "It takes 20 years to build a reputation and five minutes to ruin it." For a crypto trading center to walk the long road, it must cultivate a brand identity that users can perceive and believe in!

If a trading center relies only on transaction fees for revenue, its relationship with users is actually quite fragile. It is like going to a restaurant, you pay, they serve you food, and there is no long-term bond between you.

But when a trading center issues a platform token, it is effectively saying: I don’t just want to do one deal with you—I want you to become a long-term shareholder, even a partner who shares in both gains and losses. This is the long-termist expression of platform tokens.

In the early days of America’s westward expansion, railroads issued bonds so that everyone could become a shareholder, not just engage in one-off transactions. The relationship between platform tokens and users is, in essence, the modern version of those "railroad bonds." What you buy is not just a tool, but a share of the exchange’s future growth dividends.

If a crypto trading center has the courage to persist in operating a platform token and continues to pursue compliance certification globally, that alone reflects brand long-termism.

The stability of a platform token’s price and the breadth of its

NOVAQUANT

applications are the clearest expression of user confidence in a trading center’s brand. In this way, the brand ceases to be mere advertising and becomes something tangible—quite literally, a wallet.

The essence of wealth is transfer, not creation. Platform tokens are the bridge of wealth transfer between users and the trading center.

How can platform tokens protect user assets? This brings us to a key mechanism—reserve assets and the buyback-and-burn system. Many large platforms use their profits to repurchase and burn tokens. This not only reduces market supply and pushes up token value, but also indirectly protects user returns. In other words, the platform underwrites the token with its own profits, giving users a true sense of reassurance.

Platform tokens can not only be held but also serve as important instruments in contract trading. Their functions can be summarized in at least 3 ways:

NOVAQUANT

Deeper liquidity: Token contracts often enjoy better depth, because platforms dedicate resources to maintaining their activity.

Arbitrage opportunities: The price spread between spot and contract markets for the token often creates additional arbitrage space for users.

Preferential platform policies: Many trading centers offer their own token contracts lower fees and higher leverage—effectively giving users a "green channel."

In other words, participating in contract trading with platform tokens is like running on your "home track"—you will always have some extra advantages over the rest.

The direction of wealth migration in this era is already clear: compliance, branding, assetization, and long-termism. These 4 paths ultimately converge on one endpoint—platform tokens.

IDT/USDC is precisely such a token, and its corresponding contract trades have already attracted active participation in the market, which only enhances its liquidity and vibrancy!

Moreover, when Acumeta selects trading instruments for currency surfing, profit results are the core criteria. As long as a contract target can generate returns, it should not matter which one it is— that should never stop us from participating.

Don't you agree?

At its core, currency surfing is simply about executing spread trades —capturing short-term profit opportunities by establishing order signals, enduring interim volatility, and ultimately realizing gains. That is the true enjoyment!

And if you allow a single poor trading outcome to make you worry that one instrument's volatility will harm you, it shows that in equities you have likely made the same mistake.

It's just like trading stocks, as long as your entry price is right, you capture profit from price fluctuations. But if your entry price is wrong, then even if you buy Nvidia or Tesla, you could still incur losses. That is precisely the meaning of spreads. Do you understand now??

Token spot and token contracts are like buying fruit vs signing a fruit futures contract, both are tied to "fruit" in essence, but the way they work is completely different.

What is "token spot"?

You walk into a supermarket, see a bottle of Coke you like, and pay $3 to buy it. The Coke is now in your hand—you can drink it, or you can keep it.

That Coke is your "spot asset". You paid money to own it; it is your private property. If its price goes up, you can sell it and make a profit; if its price goes down, you bear the loss yourself. This transaction is direct and straightforward—cash for goods. It is the purest form of ownership: you hold a tangible asset.

What is a "contract"?

You walk into the supermarket, but instead of buying the Coke, you make a bet with the shopkeeper.

You say: "I bet this bottle of Coke will rise to $4 tomorrow!"

The shopkeeper says: "Fine! If you win, I’ll give you $1. If you lose, you give me $1."

No Coke is exchanged. What you two have exchanged is simply a "wager" on the Coke’s future price.

That "wager" is your "contract". A contract is not a tangible asset—it is a financial derivative. What you are trading is not the asset itself, but the rise and fall of its future price.

In our daily currency surfing, when Acumeta issues a trading signal for a contract instrument such as IDT/USDC, what we are really engaging in is a wager on the contract’s price fluctuations.

Contract trading is like your company’s "futures." You are not a shareholder of the company, but you make a bet with someone else on whether your company’s stock price will rise or fall tomorrow. If you win, you earn money; if you lose, you forfeit money. This "wager" has nothing to do with the company’s long-term development—you are simply betting on its short-term price movements.

Contract trading is more suitable for those who want to capture high returns in the short term. It is like "hunting". You don't need to own the asset, you only need to predict its direction.

The defining feature of contracts is leverage. With $10, you can control $100, or even $1000 worth of assets.

Therefore, our trading process typically lasts half an hour, an hour, or a few hours at most. But in most cases, the longer the trade is held, the greater the volatility risk, which works against us. That is why Acumeta provides a balanced trading process—issuing timely close positions signals at optimal points to lock in profits, rather than holding positions and carrying the exposure. Doing so would be detrimental to the entire trade!

How to cut down mistakes in surfing and raise your winning percentage!

When your strategy, when your signal, tells you what to do—you must execute like a robot, without hesitation!

Only by using "big capital, big positions" can you truly "surf" and truly "sail."

It is like a wealthy man investing $1,000,000 into a project. If the project rises 10%, he earns $100,000. But a poor man invests only $1,000 into the same project—if it rises 10%, he earns just $100. The accumulation of wealth has always come from "betting big to win big"!

In this market, your greatest enemy is not others—it is yourself! If you cannot master your own emotions, if you cannot face your own mistakes, you will never succeed!

A successful "currency surfer" must possess 3 qualities: reducing mistakes and improving accuracy does not come from "finding the perfect strategy," but from this:

*Execute to the end—don’t let hesitation destroy opportunity;

**Use big capital and big positions—let scale become your safety cushion.

***Learn from mistakes and move forward quickly—don’t let emotions hold you hostage.

Remember, the market is cold, but wealth is warm. As long as you adhere to these 3 principles, you will not be toppled by the waves—you will be the winner who rides them.

[The Great Wealth Wave of Rate-Cut Liberation Day] – Currency Surfing, with an Expected Potential Profit of 710% on Rate-Cut Day

As evening falls in the U.S. Eastern time zone, the sun is rising on the other side of the globe—new crypto players awaken, and the repricing of currency begins anew.

Acumeta has been continuously monitoring in real time, identifying reliable opportunities for currency surfing trades, and issuing strong alerts:

#Trading preparation: Keep your trading funds ready in your account to participate in order placement.

#Please open your INDEXBIT crypto trading center account now, go to the Quick Options trading interface, and, according to your trading capital, be ready to follow the signal prompt and execute the indicated order.

#Do not miss this! Seize the Great Wealth Wave of Rate-Cut Liberation Day and create extraordinary compounding effects of on-chain wealth!

#Please upgrade promptly to an L2 account to unlock options-trading permissions, ensuring smooth and comprehensive trading!

Today we witnessed one of the most intriguing moments in history. In the afternoon, the Fed announced a 25 bp rate cut, while earlier in the morning the Bank of Canada also announced a 25 bp cut.

This means rate cuts are no longer the act of a single "lone warrior" central bank, but rather the beginning of a "global chorus" of monetary easing. It won’t be long before the European Central Bank, the Bank of England, the Reserve Bank of Australia, and even the People’s Bank of China follow suit. Once the rhythm of rate cuts begins, it is like a line of dominoes—falling one after another. This is the overture to a new currency game and the prelude to a reshuffling of global asset prices. Don’t think that just because the sun has set today, this chapter is over.

Next, money will flow like the tide, searching for new outlets and safe havens. And in today’s financial ecosystem, what market offers more imagination and explosive potential than crypto? The honeymoon phase of currency surfing has only just begun!

The secret of winners lies not in seeing, but in acting. The "rate-cut relay race" of global central banks is, in effect, lighting green signals one after another for the crypto market.

You may not yet realize it, but this is a moment that has occurred only a handful of times in history: the overture to a great migration of capital.

I would like to once again congratulate the long-term members who today achieved their "currency surfing and Quick Options profit targets". Through action, you have proven the value of execution and foresight.

May the numbers in your account represent not just gains, but also confidence and conviction in the future.

That’s all for today’s session. Pals, stay tuned, the next couple of days I will continue bringing you even more exciting insights into the core of quantitative strategies.
