NOVAQUANT

Ladies and gentlemen, winners of the great wealth wave:

Standing here today, I cannot shake the feeling that a "tidal surge is about to hit the shore." You know it— the Federal Reserve has finally pressed that critical button: a rate cut. And this time, it’s not a "one-off firework," but a chain of successive strikes. In October, in December, we are very likely to see a series of consecutive 25 bp cuts. Put plainly, this is not a sprint, it is the first acceleration point in a marathon.

The true wealth wave is not confined to the afternoon of the press conference, rather, it begins from that moment, rolling forward wave after wave into every corner of our lives.

This means the floodgates of the dollar have been opened!

This is no longer a drizzle—it is a downpour, a financial tsunami powerful enough to wash away every old notion.

Rome was not built in a day, and neither is the great wave of wealth created overnight. The real Rate-Cut Liberation Day is not just a single Wednesday, but the start of a drawn-out battle, with waves of wealth surging toward us!

Behind the Fed’s decision lies more than just interest rates. It is like a stone thrown into the ocean of capital, with ripples striking the stock market, the bond market, real estate, crypto, and even our daily consumption.

What we must understand today is this: a rate-cut window is not a cold number—it is the perfect wave for us to surf.

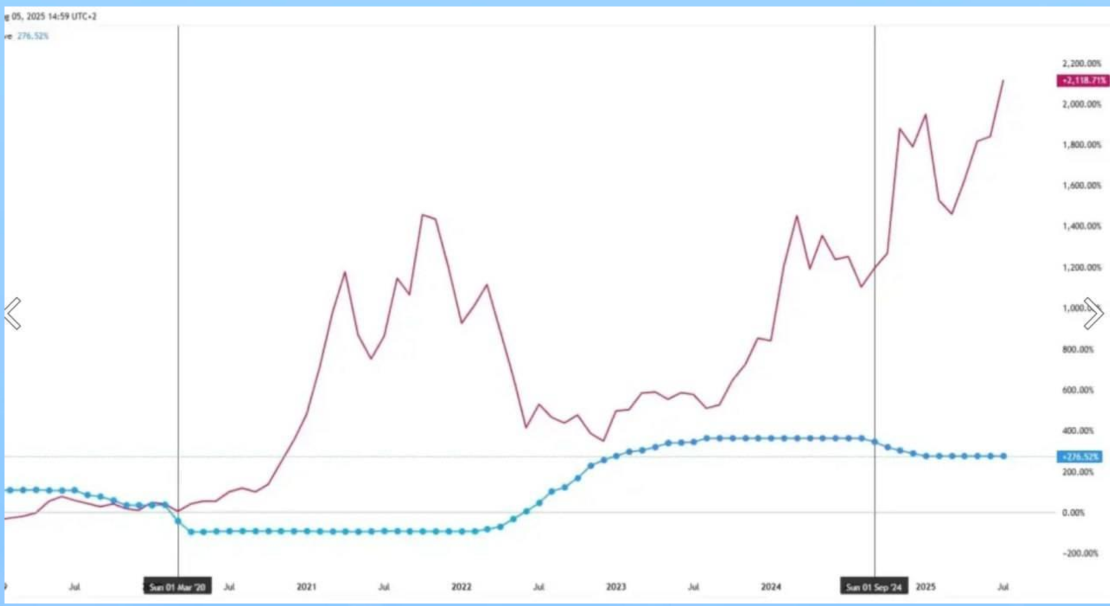
Put simply, it means riding with the trend, using market volatility to accelerate ourselves.

From Wednesday’s Rate-Cut Liberation Day onward, let us embrace this great wave of wealth! Stop hesitating, stop waiting for the perfect investment moment—seize the trading opportunity. The Fed’s successive rate cuts are like issuing us a VIP pass to the paradise of wealth.

Emotionally, they ignite our passion; theoretically, they provide solid economic support.

A rate cut is not the end—it is the prelude; not the destination, but the starting point. And the months ahead belong to those bold enough to surf, to everyone willing to catch the wave.

NOVAQUANT



Changes in interest rates are like the conductor’s baton that directs the entire grand theater of finance.

Especially when rates move downward, their reverberations stir up waves in equities, bonds, real estate, and most dramatically, in the world of crypto.

If you overlay the Fed’s rate-cut path with the chart of Bitcoin’s market cap, you’d be left open-mouthed in astonishment. The two curves move almost like twins: when rates fall, the crypto market often raises the curtain on a bull run. The 2020 rate cuts ignited that parabolic surge in crypto; and the 2024 cuts have likewise marked the beginning of another frenzy. It’s hard to call this coincidence, more likely, it is pattern, it is the pulse of the market.

Rate cuts and the crypto market are like the "pick-and-roll" in an NBA game. Falling interest rates are the point guard’s precise assist, setting up the forward with the perfect opportunity, while crypto is the player who completes the dunk. Without rate cuts, the pass might never be made; without crypto, the game would lose its excitement. But once the two work together, the whole arena erupts.

The essence of risk assets is that they are highly sensitive to liquidity. When interest rates fall, money no longer lies quietly in bank accounts—it rushes out in search of high-return adventures. And so, crypto becomes the brightest stage.

The logic is not hard to grasp. It’s like ordering drinks at a bar: when beer gets cheaper, people naturally have a few more. When the cost of borrowing falls, the market naturally takes on more risk. This is why rate cuts so often ignite crypto bull markets.

Put simply, rate cuts are not only an economic lifeline, they are also a speculator’s paradise.

NOVAQUANT

History has shown us this many times. After the 2008 financial crisis, the Fed’s series of rate cuts coincided with the birth of Bitcoin. And during the 2020 pandemic, rate cuts triggered a frenzy of crypto market gains.

And in 2024, while many still hesitate, Bitcoin and Ethereum are already writing a new chapter of legend.

Think back to the long-term membership cooperation agreement we signed two weeks ago. It was not just a contract, not just a few pages of text, but the beginning of a shared long-term voyage of wealth.

At that moment, what we decided was not only a trading strategy, but also a direction for the future. We resolved to build the Quantitative Think Tank Center into a battlefield truly our own—one without empty slogans, but with loyal partners, tangible returns, and a reputation accumulated step by step.

Why highlight the role of being among Acumeta’s earliest users and beneficiaries? The answer is simple: in any wave of wealth, those who board the ship first always stand at the bow, with the widest view of the horizon. Just like the California Gold Rush of the 19th century: the first who took shovels up the mountains did not all strike gold, but they left behind the stories and legends. Those who came late often had nothing left but tales overheard in saloons. The meaning of being among Acumeta’s first users is that each long-term partner must be the one to take the first step up the mountain.

The Fed’s rate-cut wave has arrived. Yesterday, Powell made it abundantly clear: quantitative tightening is approaching its end.

The meaning behind this statement is not merely a policy shift, but a turning point in the great tide of wealth.

Every such moment in history has been like a divine wealth banquet. Rather than trying to guess the market bottom, it is wiser to follow the path of interest rates. The greatest secret of wealth is not brilliance, but the ability to hear and interpret the signals of policy. That is the truest wealth code behind the rate-cut wave.

Last year in Miami, I met an entrepreneur who had entered the crypto market early.

He told me that his greatest advantage was not how much technology he understood, but that he knew how to follow the right people and the right team. In the depths of the 2018 bear market, he joined a quantitative trading community. And while most were busy complaining about losses, a small group within the community kept working on trading models and studying policy trends. When the rate-cut cycle arrived in 2020, they were the first to step forward, went in with large positions, and came away with overflowing gains.

The Fed’s "quantitative easing" (QE) and "quantitative tightening"

(QT). They may sound like Wall Street jargon, but at their core, they are nothing more than the turning on and off of a faucet.
Easing means turning the faucet on, letting money pour out like running water; tightening means turning the faucet off, or even trying to pump the water back.

Quantitative easing (QE) is the Fed flooding the market with money —buying Treasuries, buying MBS, injecting liquidity into the financial system. The purpose is simple: to rescue the market and prevent a financial blood shortage.

Quantitative tightening (QT), on the other hand, is the Fed reaching back into the market to withdraw the money it previously released. It stops buying, and may even sell assets, making funds scarcer. It’s like parents giving a child pocket money, during easing, they stuff cash into your pocket as soon as you walk out the door; during tightening, not only do they stop giving, they check your pockets and take back the extra.

The first round of quantitative easing in history happened in 2008. That year, America’s financial crisis broke out like a tsunami; that was the starting point of QE. People even joked at the time that the Fed had put the market on a ventilator—because otherwise, it wouldn't have survived.

The Fed rolled out QE1, QE2, and QE3 one after another, like round after round of a "money-printing feast." And the result? From 2009 onward, the U.S. stock market soared, with the S&P 500 multiplying several times over. Bitcoin was also born in 2009, and many still remember that during that period, anyone brave enough to buy Bitcoin could make money with their eyes closed.

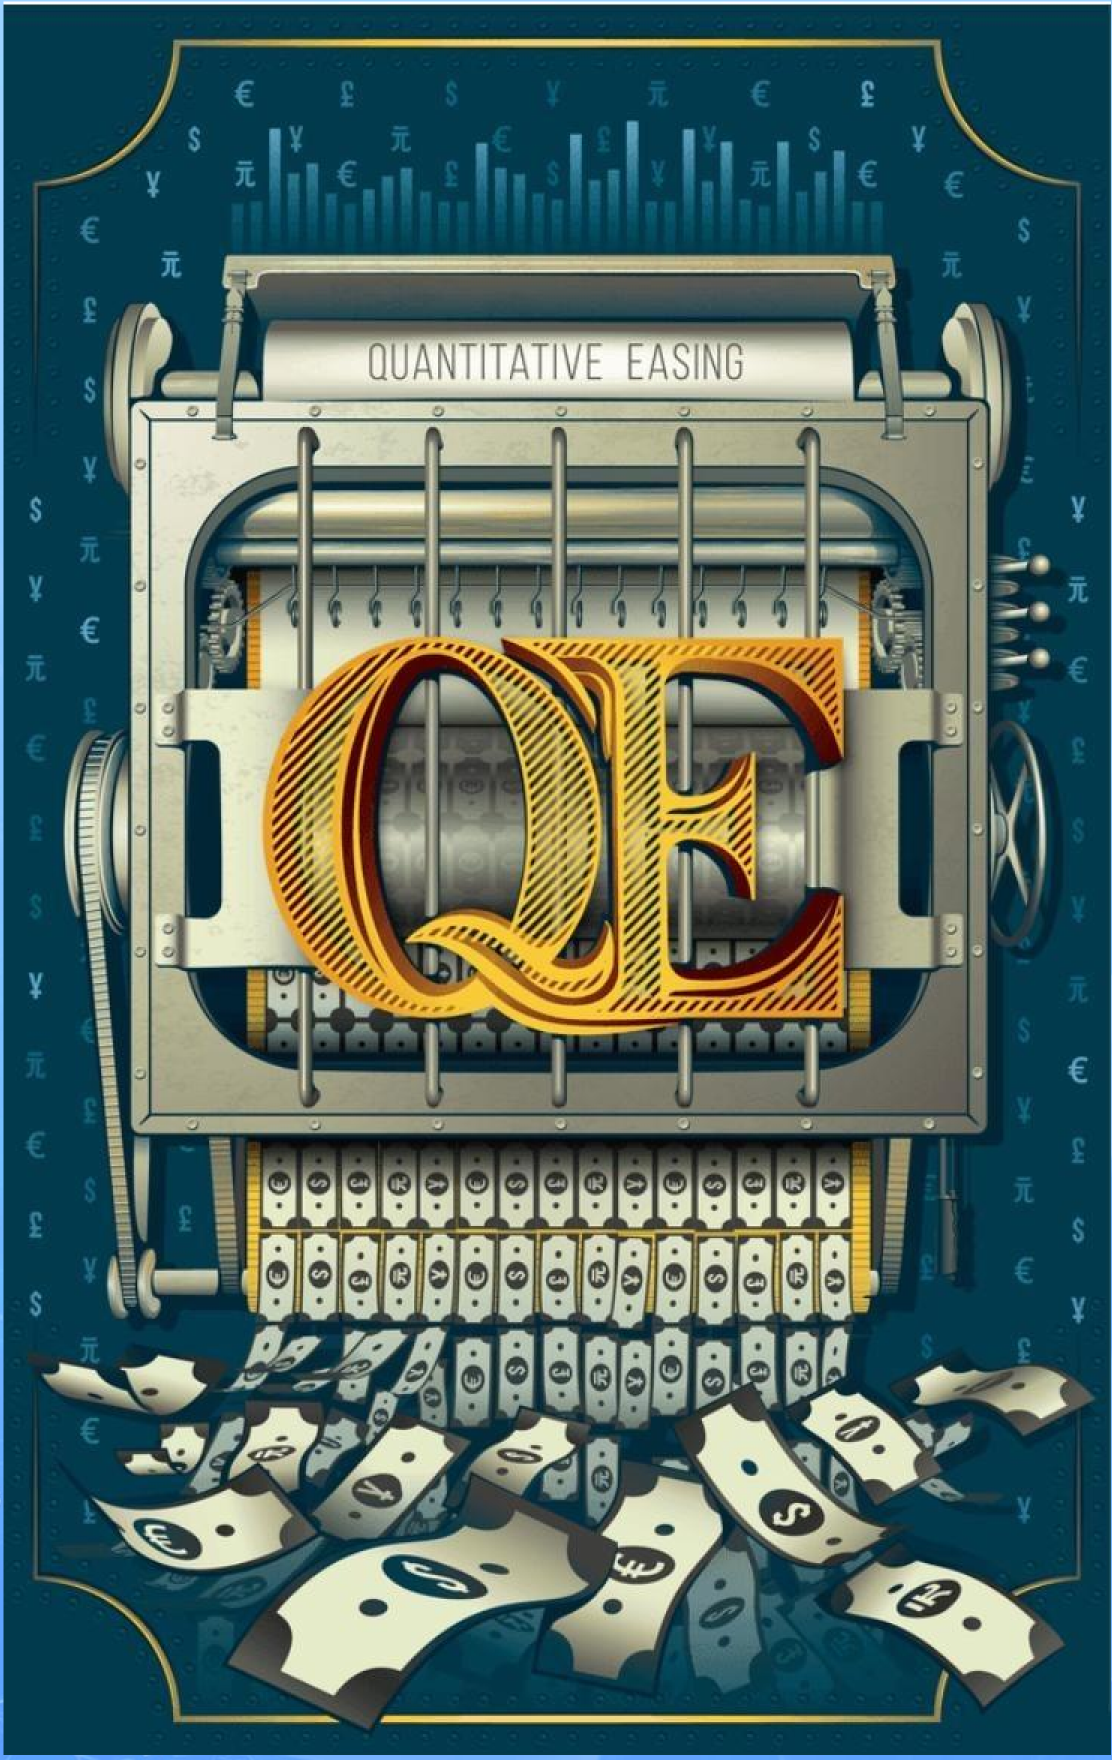
That was the most direct outcome of quantitative easing.

When did quantitative tightening begin? The answer is 2017. By then, the U.S. economy was gradually recovering, and the Fed believed the market had "healed" and could no longer stay on a constant drip-feed of liquidity; too much money would instead trigger inflation. So they began to tighten policy, reducing bond purchases and even shrinking the balance sheet. That was the start of QT.

Imagine someone who has been living on high-calorie supplements suddenly being told by their doctor to lose weight—no more sugar, and on top of that, a few extra kilometers of running every day. That is how the market felt facing QT. By 2018, the strain showed, and U.S. equities plunged at year-end.

The truly historic moment came in 2020 with the outbreak of the pandemic. The global economy hit the pause button, and the Fed immediately pivoted back into full-scale QE. That moment marked the definitive turn from QT back to QE. That year, Bitcoin surged from just a few thousand dollars all the way to $60k, because the market had been completely flooded with money.

NOVAQUANT



By 2022, the situation had reversed. Inflation in the U.S. had surged off the charts, prices were soaring, and the Fed had no choice but to tighten again. They raised rates aggressively and launched the most radical round of QT in history. U.S. equities languished in 2022, and Bitcoin plunged from $60k to below $20k.

And now, we are once again at a new inflection point. As of 2025, Powell has already hinted that the end of quantitative tightening is in sight, and the market has begun to sense the breath of a new round of easing. QE and QT are like two cards in the Fed’s hand: one is a trump card that can ignite market euphoria; the other is a brake that can cool down bubbles. To understand how these cards are played is to understand the direction of wealth.

Keep these defining moments in mind:

2008, the beginning of QE; markets reborn from despair.

2017, the launch of QT; markets begin to feel tightening pressure.

2018, U.S. equities plunge at Christmas; the side effects of QT surface.

2020, the pandemic hits; the Fed unleashes unlimited QE, and the world enters the era of money flooding.

2022, inflation spirals out of control; QT + rate hikes trigger a broad market cooldown.

2025, QT nears its end; expectations of easing once again ignite risk assets.

Each of these moments is a critical fork in the road for the distribution of market wealth. Some lose their chance by hesitating; others soar by acting decisively.

Pals, this is precisely the brand path we are building.

We are not here to shout empty slogans, nor to chase short-term gains. We are here to build reputation through long-term cooperation and real, hard-won trading returns, to create a wealth story worth retelling.

When the Fed’s wave of rate cuts comes again, our task is not to watch, but to act. With Acumeta, we will turn this great wave into tangible trading profits. With our membership program, we will transform individual risk-taking into collective intelligence. With real cases, we will craft our own wealth narrative.

We cannot remain like those old-school investors who cling to "cash is king," watching helplessly while others celebrate.

The duet of rate cuts and a crypto bull market has already begun! With the October and December cuts approaching, this is our moment to seize crypto fortune!

Don't hesitate—grasp this wave of wealth!

How should we understand the projected 530% return under Thursday's potential volatility in currency surfing?

1. This is a forecast figure, not an actual return, at the very least, it demonstrates that Acumeta's quantitative reasoning has identified profit potential within this range.

2. Even if you only participated once and secured a single 80% gain, it would still prove that you captured success within this larger return profile. It's like having a tank with 10 fish—catching one doesn't change the fact that 9 still remain.

3. The algorithm for calculating currency surfing returns is extremely simple:

Suppose the XXX/USDC contract price is $20. If you open a 100x leveraged currency surfing trade and the price rises by $0.20 (that is, 1%), your position moves from $20 to $20.20, at that point, your order profit is 100%.

Let's say your order size was $10k, your profit would also be $10k.

If your order size was $300k, your profit would be $300k.

And so forth.

This is how each individual order’s profit is projected and compounded, do you see how it works??

Today, we have ridden the waves together and captured profits along the way. As we draw to a close, I’d like to offer something lighter yet more enduring, much like a glass of wine after dinner, not to get one drunk, but to deepen the aftertaste

Wealth, in many ways, is like surfing. But the waves worth pursuing with full commitment do not appear every day. In quantitative strategy, in "currency surfing," the lesson is the same— the goal is not to chase every single swell, but to hold our rhythm, steady and deliberate.

I want to extend a particular invitation to our long-term members to share your experiences and reflections with us. Do not underestimate the value of this. It is not a perfunctory "comment"; it is an accelerator of our collective progress. Your experiences are Acumeta’s touchstone; your voices, the compass that helps us refine our path. Our presence here today is not the result of solitary effort, but of collective endeavor, shoulder to shoulder.

Pals, the meaning of wealth has never been confined to numbers in an account, it is also the transmission of responsibility, of trust, of care. You entered with trust, and we advance with responsibility; you draw confidence from returns, and we draw progress from your feedback. This is a journey of mutual pursuit.

And this afternoon, we will continue exploring new frontiers of currency surfing, keeping this celebration of wealth alive.

NOVAQUANT

Big winners of currency surfing:

This afternoon’s theme is about far more than numbers and curves; it speaks to an event that will shape the destiny of every American household’ s wealth.

On Thursday, markets erupted in celebration as the Federal Reserve initiated its long-anticipated rate cut.

By all accounts, this should have been a moment of celebration for financial markets. Yet one development doused the party with cold water: an error in the initial jobless claims report. The revised figures were sobering—the increase in claims points to mounting stress in the labor market, and once again magnifies the shadow of economic decline.

In other words, this moment marks not only a turning point in interest rates, but also a critical juncture for how we must shape our wealth strategies.

From a short-term perspective, lower rates unleash liquidity, like pouring fuel on a fire, making risk assets burn brighter. But we must not forget the essence of rate cuts: they come because the economy is weakening and in need of stimulus. It is akin to a doctor administering morphine—effective in easing pain in the short run, but always carrying the hidden warning that the underlying illness is worsening.

NOVAQUANT

Today’s data serves as a stark reminder. Rising jobless claims reflect mounting pressure on companies to cut jobs; behind this lies precisely the reason the Fed is compelled to continue lowering rates. Consecutive cuts in October and December now appear almost inevitable.

In other words, we stand at the threshold of a new wealth cycle: the dollar will continue to depreciate, and your assets will either be eroded or take flight in this turning point.

What must we see through in today’s so-called rate-cut celebration? That the dollar’s decline is only a matter of time. Inflationary pressures will not vanish with a single rate cut, on the contrary, they are likely to intensify. And what does this mean for every American household? It means that if your money sits in a savings account, it shrinks with each passing day; if your strategy remains unchanged, your purchasing power will be swallowed in silence.

I know these words may sound a little heavy. But from another perspective, what we face is both a crisis and an opportunity. In the context of a weakening dollar, the logic of asset allocation changes entirely. Gold, Bitcoin, and Ethereum all stand as safe havens against inflation.

Particularly with crypto, in the 2020 rate-cut cycle, they experienced a parabolic rise. This time, history may well be repeating itself.

What we call "currency surfing" is precisely about capturing these waves of opportunity within such cycles. The rate cuts expected in October and December are the precursors of just such a pivotal swell.

Pals, as the dollar’s decline quietly erodes wealth, the answer is not complaint but action. Ask yourself: Is my asset allocation sufficiently diversified? Is my investment strategy resilient enough to withstand the volatility ahead? Do I have the right tools to seize this rate-cut wave?

And this, in fact, is the very reason we built the Quantitative Think Tank and the Acumeta system. It is not designed to guarantee flawless success in every trade, but to help you win with a probability of over 85%. It is not meant to drive blind imitation, but to foster calm and deliberate choice. For the essence of wealth surfing lies not in fleeting thrills, but in enduring steadiness.

Over the past two days, Trump’s visits to the United Kingdom and Europe were more than ceremonial diplomacy. What he signaled was a series of favorable trends for crypto. At the same time, the

European Union has made a public commitment to advance pension reforms involving crypto investment before the end of this year.

This is no small gesture—it represents a decisive turn of major capital. The move echoes almost perfectly with the gradual acceptance of crypto within the U.S. pension system.

Can you imagine? The pension funds of the world’s two largest economies—the most stable and long-term investment pools—are both opening the door to crypto. This is not coincidence, it is a historic shift in direction.

And what are pensions? They are the hard-earned safeguards of wealth accumulated over generations, the very foundation of social stability. When such funds begin considering allocations to crypto, the implication is clear: sovereign capital worldwide has already caught the scent of anticipated appreciation in digital assets.

The question before us is how we ought to approach this wave?

First, recognize the trend. In recent years, crypto has evolved from a phase of unregulated growth to one of increasing compliance. The

approval of spot Bitcoin ETFs in the United States is a vivid example, as is the passage of the three major crypto bills.
Europe’s pension reform plans are another powerful signal.
It is as though the bells of two worlds have rung in unison, reminding everyone that a new channel of wealth distribution has opened.

Second, have the courage to step onto the field. Many watch crypto’s volatility with unease, saying: it rises one day and falls three—how could pensions possibly be placed here? But I tell you, it is precisely because of volatility that it holds the potential to surpass traditional assets. And volatility in crypto, when met with the right tools and strategies, is not a risk, but an opportunity.

Third, employ method. We are not speculators chasing blindly, we are investors equipped with quantitative strategies and AI-driven tools. Within the Acumeta system, for instance, we deploy algorithms to capture price differentials, transforming the market’s complex rhythms into clear, actionable signals

We stand at a pivotal moment in history. Trump’s visit to Europe and the EU’s reform commitments are not merely news items, they mark a redrawing of the global sovereign capital map of wealth.

As U.S. and European pension funds move into crypto, it is as if two waves meet in the distance, merging into a greater surge. At this moment, whether you welcome it or not, this wave will come rushing toward you.

We are on the right path. This is not only a trend but a window of destiny. As the old saying goes, "Opportunity does not knock twice." When sovereign capital has already entered the field, what remains for ordinary investors is to seize the wave. Because in a few years, when you look back, you will realize this was the very starting point of wealth redistribution.

On Wednesday, the very day the Fed announced its rate cut, a golden statue of Donald Trump was erected outside the U.S. Capitol—and in his hand, he was clutching Bitcoin. Was this a coincidence? Certainly not! It was the most vivid metaphor at the intersection of politics and finance, of present reality and future possibility.

What is the Capitol? It is America’s civic temple, the symbol of democracy, the very heart of national power and institutional order.

To raise a statue there is already laden with meaning. Yet this was no ordinary statue, a golden Trump, holding not the Constitution, not a flame, but Bitcoin. The implication is unmistakable, the emblem of a new American spirit and of future wealth may no longer rest solely with the dollar, but with the rising force of crypto.

In the 1970s, under the dual shock of the Vietnam War and soaring inflation, President Nixon announced the end of the dollar’s convertibility into gold. That moment was historic: gold ceased to be the sole anchor of wealth, and the dollar assumed its role as the central actor of global finance. Today, a statue of Trump clasping Bitcoin suggests a parallel signal—that Bitcoin is gradually being conferred new legitimacy, and may, in time, become part of the anchor of wealth itself.

[The Great Wealth Wave of Rate-Cut Liberation Day] — Currency Surfing

Thursday’s potential volatility trade return: 530%

While the stock market closed its doors this afternoon, the crypto

NOVAQUANT

market never sleeps. Acumeta continues real-time monitoring, identifying reliable trading opportunities in currency surfing and issuing strong forecast alerts:

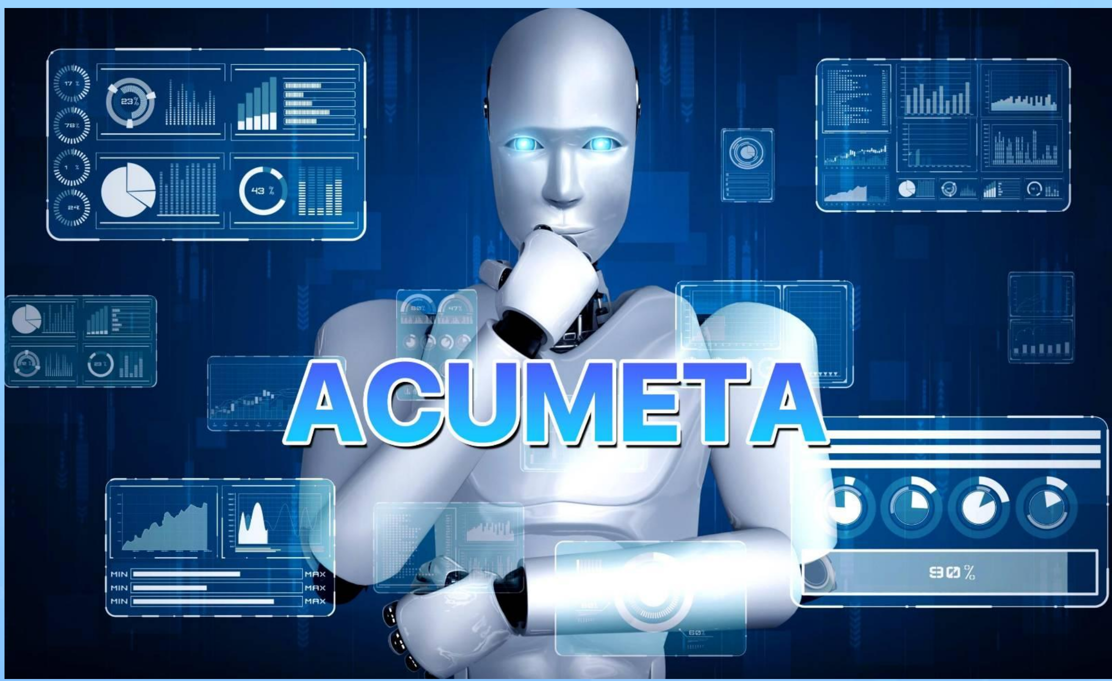
#Trading preparation: Transfer your trading funds into your currency-surfing account and prepare for order placement.
#If you wish to participate in quick options, make sure your account retains sufficient funds;

#Please now open your account on the INDEXBIT crypto trading center, go to the currency surfing trading interface, and, based on your available funds, be ready to follow the signal prompt and execute the order.

#Do not miss this! Seize the Great Wealth Wave of Rate-Cut Liberation Day and create extraordinary compounding effects of on-chain wealth!

#Please upgrade promptly to an L2 account to unlock options trading access, enabling smooth and comprehensive trading!

NOVAQUANT



The old rules of the game are breaking down, and a new order of wealth is taking shape. At such a turning point in history, we must reexamine our own wealth strategies.

In the recent period, we have gone through the live experience of currency surfing together. In just a few weeks, I have received feedback from members across regions and with varying levels of capital. These voices have not only given me a clearer view of the path we have traveled, but also made me realize that our future direction must be even more precise.

So today, I want to take a moment for a mid-course reflection, to share with all of you still on this ship the lessons we’ve gained, the insights we’ ve drawn, and the road that lies ahead.

The first point: in the past, our trading signals tended to be broad. What does this mean? Imagine a physician prescribing medication: if he merely says, "this drug works," the dosage will differ greatly depending on whether the patient’ s condition is mild or severe. Without tailored dosage, those with lighter conditions may find the medicine too strong, while those with more serious conditions may feel it insufficient. Currency surfing signals work the same way. When members with very different levels of capital receive the same signal, some feel the risk is too high, others that the exposure is too weak. This reminds us that, going forward, our signals must be tiered and calibrated, designed to meet the entry and exit needs of large capital while also accommodating the agility required by smaller accounts.

Second point, a word about Acumeta’ s win rate. Some newcomers to currency surfing arrive with a certain illusion—asking whether success is 100% guaranteed, or whether it is a path to overnight wealth.

If anyone ever tells you there is a "100% win rate," turn away at once, for it is certainly a fraud.

The logic of Acumeta is simple: win more, err less. Over the recent period, our win rate has been steadily improving, with a target of stabilizing above 85%.

That is a healthy proportion, sufficient to ensure the compounding effect of long-term profitability, while avoiding the trap of perfectionism. I like to put it this way: "A true master is not someone who never falls, but someone who, after falling, can rise and keep running."

Third point, member service must be differentiated. Consider a restaurant: some guests want steak, others only want soup. You cannot simply serve everyone a steak and claim, "this is the best." Service is no different. Some members want the excitement of high-frequency trading; others prefer the steady gains of medium- and long-term positions; still others most value one-on-one guidance and support. We must tailor our services as one would a bespoke suit, crafted to fit each member, so that everyone can genuinely feel the value.

Fourth point, many members have expressed a desire for specialized guidance.

What does this mean? It is like learning to swim, some prefer to explore slowly on their own, while others feel reassured when a coach stands poolside, calling out, "Lift your head! Breathe! Stay calm!"

That sense of security gives them the confidence to step into the water. Acumeta’s future development must take this need into account. We must not only provide strategy, but also offer presence and guidance.

Fifth, and most importantly: the future path of Acumeta is to make our members the very first users at the frontier.

History has always rewarded the pioneers. And today, we stand at such a window of opportunity. To be among the first users does not merely mean earning ahead of others; it means positioning yourself at the crest of the trend, enjoying the dividends before others have even begun to react.

Pals, what we are experiencing is nothing less than a reshuffling of wealth.

Rate cuts, the weakening dollar, even the statue of a president holding Bitcoin outside the Capitol—these are not isolated events, but signals of a broader transfer of wealth.

As members, you are already ahead of the curve.

Your feedback, your persistence, and your choices today are paving the way for your future selves.

The first is "focus". do not be distracted by noise, do not let a single loss shake you, do not abandon the long-term direction because of short-term turbulence.

The second is "optimization". Whether it is our signals, our services, or your own trade execution, everything must be reviewed and refined—always seeking to be better today than yesterday.

The third is "joining hands". This is a team game, not a solo performance. Your feedback, your growth, and Acumeta's evolution are all resonating on the same frequency.

Currency surfing is not only about today's profits, it is about preparing for the great waves of wealth to come, moving forward with conviction and with responsibility.

In June 2024, tennis legend Roger Federer delivered the commencement address at Dartmouth College in the United States, where he shared three main pieces of life advice:

First, that "effortless" is a myth—success is always the union of talent and hard work;

Second, learn to focus on the next point after losing one; let the past become past, and stay present.

Third, life is a team sport—treat others well, and enjoy the journey.

On our own journey of "currency surfing," small setbacks are inevitable. Perhaps you missed the perfect wave; perhaps you lingered too long where you should have moved on; perhaps your paddle stroke was less than perfect, sending you slightly off course. Each misstep is an opportunity to learn. Each failure is a chance to grow stronger.

We are now planning to provide our senior members with personalized strategic guidance. Based on your capital position and risk preferences, we will chart for you a customized "wealth navigation map" best suited to your course.

THE GREAT WEALTH WAVE OF RATE -CUT LIBERATION DAY

PERFORMANCE LEADERBOARD

DATE	ACUMETA PROJECTED RETURN RATE	TRADE TYPE		REALIZED RETURN RATE	TOTAL SIGNALS
		CURRENCY SURFING	QUICK OPTIONS		
Monday	260%	2 times	2 times	276%	2 times
Tuesday	430%	2 times	2 times	380%	2 times
Wednesday	710%	3 times	3 times	570%	3 times
Thursday	530%	2 times	2 times	420%	2 times
Friday	390%				
Saturday & Sunday	210%				

You don’t drown because you fall into the water—you drown because you refuse to stand up again.

NOVAQUANT

I am deeply grateful for all the feedback you’ve given me and my team. To be honest, hearing these candid voices feels a bit like being worked over by a trainer in the gym—painful, yes, but growth-inducing. Your feedback is the fuel for our next stage of wealth evolution. We have already launched an urgent internal brainstorming— and, as you know, the answers may come quickly, perhaps even tomorrow. This is a solution designed to feel more convenient, more efficient, more secure—while further amplifying the appreciation of your wealth.

And when our new plan for currency surfing is unveiled, will you be among the very first to step forward, to be that early participant? Let your real actions and tangible profits give me the loudest answer.

They are, in truth, your "ticket" to financial freedom.

1. Wealth is not built on luck, but on alignment—knowing when to seize the wave.

2. Mistakes are not the end, but a form of navigation, pointing you toward the next opportunity.

3. The true winner is not the one who has never fallen, but the one who rises again and again, smiling as he says: "Once more!"

NOVAQUANT

See you on Friday. Come back with answers, with profits, and with your brightest smile. Thank you all!
